EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the noise exposure and the necessary noise mitigation measures for the proposed Altitude Business Centre development ("Project"). The Project site is located between Kimball Avenue and Bickmore Avenue on either side of the future Mayhew Avenue in the City of Chino. The total Project development is proposed to consist of up to 1,313,000 square feet (sf) of building space with warehousing, light industrial, business park, and self-storage uses. At the time this noise analysis was prepared, the future tenants of the proposed Project were unknown, and therefore, this noise study includes a conservative analysis of the proposed Project uses. This study has been prepared to satisfy applicable City of Chino standards and thresholds of significance based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

OFF-SITE TRAFFIC NOISE ANALYSIS

Traffic generated by the Project will influence the traffic noise levels in surrounding off-site areas. To quantify these off-site traffic noise increases on existing and future land uses, the changes in traffic noise levels on 42 study-area roadway segments were calculated based on the change in the average daily traffic (ADT) volumes. The traffic noise levels provided in this analysis are based on the traffic forecasts found in the *Altitude Business Centre Traffic Impact Analysis* prepared by Urban Crossroads, Inc. (2) To assess the off-site noise level impacts associated with the proposed Project, noise contour boundaries were developed for Existing, Opening Year 2018, Opening Year 2019, Opening Year 2020, Horizon Year 2040 without Limonite Avenue extension, and Horizon Year 2040 with Limonite Avenue extension conditions. The off-site traffic noise analysis shows that the unmitigated Project-related traffic noise level increases under all with Project traffic scenarios are considered *less than significant* impacts at land uses adjacent to the study roadway segments.

OPERATIONAL NOISE ANALYSIS

Using reference noise levels to represent the expected noise sources from the Altitude Business Centre site, this analysis estimates the Project-related stationary-source noise levels at nearby sensitive receiver locations (R1 to R7). The normal activities associated with the proposed Altitude Business Centre are anticipated to include roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity. The operational noise analysis shows that the Project-related stationary-source noise levels at all receiver locations (R1 to R7) will satisfy the applicable City of Chino daytime and nighttime exterior noise level standards, and therefore, the operational noise level impacts will be *less than significant*.

Further, this analysis demonstrates that the Project will not contribute a long-term operational noise level impact to the existing ambient noise environment at any of the sensitive receiver locations (R1 to R7). Therefore, the operational noise level impacts associated with the proposed 24-hour seven days per week Project activities, such as the roof-top air conditioning units, idling

trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity, are considered *less than significant*.

OPERATIONAL VIBRATION ANALYSIS

The operation of the Project site will include heavy trucks moving on site to and from the loading dock areas. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. Typical vibration levels for the Altitude Business Centre heavy truck activity at normal traffic speeds will approach 0.004 in/sec peak-particle-velocity (PPV) and 0.003 in/sec root-mean-square (RMS) velocity at 25 feet based on the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment.* (3) Trucks transiting on site will be travelling at very low speeds so it is expected that delivery truck vibration impacts at nearby homes will satisfy the City of Chino vibration threshold of 0.05 in/sec RMS, and therefore, will be *less than significant*.

CONSTRUCTION NOISE ANALYSIS

Construction noise represents a short-term increase on the ambient noise levels. Construction-related noise impacts are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Project site when certain activities occur at the closest point to the nearby receiver locations from primary Project construction activity. Using sample reference noise levels to represent the planned construction activities of the Altitude Business Centre site, this analysis estimates the Project-related construction noise levels at nearby sensitive receiver locations and evaluates potential impacts based on the City of Chino 65 dBA L_{eq} construction noise level threshold.

Since Project construction will include potential off-site roadway and utility improvements which extend beyond the Project site boundaries, as shown on Exhibit ES-A, the construction noise and vibration analyses include three additional sensitive receiver locations (R8 to R10) for analysis adjacent to the off-site improvement areas of activity. Further, the construction noise analysis evaluates the highest reference construction noise activity at the nearby receiver locations from the daytime, nighttime concrete pour, and off-site improvement activities related to Project construction.

DAYTIME CONSTRUCTION NOISE LEVELS

The daytime construction noise levels are expected to approach 77.2 dBA L_{eq} and will exceed the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at three of the 10 sensitive receiver locations: R1, and R3 to R5. Therefore, the unmitigated noise impact due to daytime Project construction is considered *potentially significant* at receiver locations R1, and R3 to R5 during daytime construction activities. All other receiver locations will experience unmitigated *less than significant* noise impacts during daytime construction activities.

NIGHTTIME CONCRETE POUR NOISE LEVELS

Nighttime concrete pour activity noise levels are shown to approach 59.0 dBA L_{eq} and will satisfy the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at all the sensitive receiver locations. Therefore, the unmitigated noise impact due to nighttime Project construction is considered *less than significant*.

OFF-SITE IMPROVEMENT ACTIVITY NOISE LEVELS

Off-site improvement activity noise levels are shown to approach 65.3 dBA L_{eq} and will exceed the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at one of the 10 sensitive receiver locations, R9, adjacent to off-site improvements on Mayhew Avenue. Therefore, the unmitigated noise impact due to Project off-site improvement construction activities is considered *potentially significant* at receiver location R9. All other receiver locations will experience unmitigated *less than significant* noise impacts during off-site improvement activities.

CONSTRUCTION NOISE MITIGATION MEASURES

Temporary construction noise mitigation measures are required to reduce these impacts at receiver locations R1, and R3 to R5 during the daytime hours, and at R9 during off-site improvements. This includes mitigation in the form of a 150-foot buffer zone for large construction equipment (e.g. dozers, graders, scrapers, etc.) from receiver locations R1 and R3 to R5, if built and occupied at the time of Project construction, and an 8-foot high temporary noise barrier for receiver locations R4 and R5 if built and occupied at the time of Project construction. Further, the existing residential home represented by receiver location R9 adjacent to off-site improvements shall require either a temporary 8-foot high noise barrier or sound dampening mats capable of a minimum 5 dBA L_{eq} noise reduction for heavy mobile equipment engine compartments (e.g., cement mixers, dozers), as shown on Exhibit ES-A.

The construction noise analysis presents a conservative approach with the highest noise-level-producing equipment for each stage of Project construction operating at the closest point from primary construction activity to the nearby sensitive receiver locations. This scenario is unlikely to occur during typical construction activities and likely overstates the construction noise levels which will be experienced at each receiver location. With the construction noise mitigation measures identified in this noise study, shown on Exhibit ES-A, the worst-case construction noise levels at the nearby residential receivers would be reduced to a *less than significant* impact with mitigation. Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following mitigation measures are required to reduce noise and vibration levels produced by the construction equipment to the nearby sensitive residential land uses.

On-Site Construction Activity

- Install minimum 8-foot high temporary construction noise barriers at the construction activity boundaries adjacent to sensitive receivers R1, and R3 to R5, if they represent built and occupied noise-sensitive use at the time of Project construction, as shown on Exhibit ES-A.

The noise control barriers must have a solid face from top to bottom. The noise control barriers must meet the minimum height and be constructed as follows:

- The temporary noise barriers shall provide a minimum transmission loss of 20 dBA (Federal Highway Administration, Noise Barrier Design Handbook). The noise barrier shall be constructed using an acoustical blanket (e.g. vinyl acoustic curtains or quilted blankets) attached to the construction site perimeter fence or equivalent temporary fence posts;
- The noise barrier must be maintained, and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired;
- The noise control barrier and associated elements shall be completely removed, and the site appropriately restored upon the conclusion of the construction activity.

- The use of large construction equipment (e.g., dozers, graders, scrapers) with sound power level ratings greater than 100 dBA. If the contractor can demonstrate that specific pieces of large construction equipment have sound power level ratings equal to or below 100 dBA, then the equipment shall be allowed to operate within the buffer zone shown on Exhibit ES-A.

Off-Site Construction Activity

- One of the following two mitigation measures (temporary noise barriers or sound dampening mats) shall be used during off-site improvement construction activities on Mayhew Avenue adjacent to receiver location R9:
  - Install minimum 8-foot high temporary construction noise barrier at the construction activity boundaries adjacent to sensitive receiver R9, if R9 represents built and occupied noise-sensitive use at the time of Project construction, as shown on Exhibit ES-A. The noise control barriers must have a solid face from top to bottom. The noise control barriers must meet the minimum height and be constructed as follows:
    - The temporary noise barriers shall provide a minimum transmission loss of 20 dBA (Federal Highway Administration, Noise Barrier Design Handbook). The noise barrier shall be constructed using an acoustical blanket (e.g. vinyl acoustic curtains or quilted blankets) attached to the construction site perimeter fence or equivalent temporary fence posts;
    - The noise barrier must be maintained, and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired;
    - The noise control barrier and associated elements shall be completely removed, and the site appropriately restored upon the conclusion of the construction activity.
  - Install sound dampening mats or blankets to the engine compartments of heavy mobile equipment (e.g., cement mixers, dozers) capable of a minimum 5 dBA noise reduction (FHWA, Construction Noise Special Report). (4) The dampening materials must be capable of the minimum 5 dBA noise reduction and can be made of commercially-available sound dampening materials, including but not limited to polyurethane foam and vinyl sheeting (University of Massachusetts Lowell The Use of Noise Dampening Mats to Reduce Heavy-Equipment Noise, provided in Appendix 11.2). (5)

- The sound dampening mats or blankets must be installed prior to the use of heavy mobile construction equipment within the Project site;
- The sound dampening mats or blankets must remain installed for the duration of the use of the equipment during Project construction.

All Construction Activity

- Prior to approval of grading plans and/or issuance of building permits, plans shall include a note indicating that Project construction activities shall comply with the City of Chino Municipal Code requirements.
- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site during all Project construction (i.e., to the center).
- The contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

CONSTRUCTION VIBRATION ANALYSIS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference velocity of 0.089 in/sec PPV at 25 feet. At distances ranging from 62 to 1,691 feet from Project construction activities, construction vibration velocity levels are expected to approach 0.016 in/sec RMS at the nearby receiver locations. Based on the City of Chino Municipal Code standard of 0.05 in/sec RMS, the proposed Project construction activities will satisfy the vibration standard of 0.05 in/sec RMS at all receiver locations during Project construction. Therefore, the Project-related vibration impacts will be *less than significant* during the construction activities at the Project site.

Further, the Project-related construction vibration levels do not represent levels capable of causing building damage to nearby residential homes. The FTA identifies construction vibration levels capable of building damage ranging from 0.12 to 0.5 in/sec PPV. (3) The peak Project-construction vibration levels, approaching 0.023 in/sec PPV, will not exceed the FTA vibration levels for building damage at the residential homes near the Project site. Further, the impacts at the site of the closest sensitive receivers are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating adjacent to the Project site perimeter.

SUMMARY OF SIGNIFICANCE FINDINGS

The results of this Altitude Business Centre Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF SIGNIFICANCE FINDINGS

Analysis	Report Section	Project-Related Significance Findings	
		Unmitigated	Mitigated
Off-Site Traffic Noise	7	*Less Than Significant*	*n/a*
On-Site Aircraft Noise	3	*Less Than Significant*	*n/a*
Operational Noise	9	*Less Than Significant*	*n/a*
Operational Vibration		*Less Than Significant*	*n/a*
Construction Noise	10	*Potentially Significant*	*Less Than Significant*
Construction Vibration		*Less Than Significant*	*n/a*

"n/a" = No mitigation required since the impact will be less than significant.

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Altitude Business Centre ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, describes the local regulatory setting, provides the study methods and procedures for traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term operational and short-term construction noise impacts.

1.1 SITE LOCATION

The proposed Altitude Business Centre site is located between Kimball Avenue and Bickmore Avenue on either side of the future Mayhew Avenue in the City of Chino, as shown on Exhibit 1-A. The Project site is currently occupied by existing agricultural uses. Existing land uses near the site include existing residential homes east and south of the Project site, with future residential-designated land use located on undeveloped land adjacent to the southern site boundary. At the time of this noise study, the residential-designated use east of the Project site was under construction. An existing fire station is located north of the Project site across Kimball Avenue, and McBride's RV Storage is located immediately west of the Project site. Chino Airport is located roughly 450 feet north of the Project site across Kimball Avenue.

1.2 PROJECT DESCRIPTION

Exhibit 1-B illustrates the preliminary Project site plan. As shown on Exhibit 1-B, the total development is proposed to consist of up to 1,313,000 square feet (sf) of building space with the following uses:

- 715,000 sf of warehousing use within 4 buildings (Buildings 3, 4, 5, and 6). Warehouse use has been utilized for a portion of the buildings that are proposed to include dock doors;
- 255,000 sf of general light industrial use within 3 buildings (Buildings 1, 2, N, and O). General Light Industrial use has been utilized for remaining buildings that are proposed to include dock doors;
- 233,000 sf of business park use within 14 buildings (Buildings 7A, 7B, 8, 9, and A through L). The business park land use has been utilized for all the remaining smaller buildings without dock doors; and
- 110,000 sf of self-storage use within 1 building (Building 2).

The Project is planned to be completed in 3 phases, as outlined on Exhibit 1-B:

- Phase 1 (2018): Buildings 4, 5, and 6 – 515,000 sf Warehouse use;

- Phase 2 (2019): Buildings 1, 2, and 3 – 194,000 sf of General Light Industrial use and 200,000 sf Warehouse use; and
- Phase 3 (2020): Buildings M, N, O, 7A, 7B, 8, 9, and A through L – 61,000 sf General Light Industrial use, 233,000 sf Business Park use, and 110,000 sf of Self-Storage use.

At the time this noise analysis was prepared, the future tenants of the proposed Project were unknown. The on-site Project-related noise sources are expected to include: roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity. This noise analysis is intended to describe noise level impacts associated with the expected typical operational activities at the Project site.

Per the *Altitude Business Centre Traffic Impact Analysis* prepared by Urban Crossroads, Inc. the Project is expected to generate a net total of approximately 7,496 trip-ends per day (actual vehicles) and includes 1,695 truck trip-ends per day from the proposed buildings within the Project site. (2) This noise study relies on the net Project trips (as opposed to the passenger car equivalents) to accurately account for the effect of individual truck trips on the study area roadway network.

2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	NO EFFECT
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0		

Source: Environmental Protection Agency Office of Noise Abatement and Control, Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA/ONAC 550/9-74-004) March 1974.

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (6) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 100 feet, which can cause serious discomfort. (7) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

To describe the time-varying character of environmental noise, the statistical or percentile noise descriptors L_{50}, L_{25}, L_8 and L_2, are commonly used. The percentile noise descriptors are the noise levels equaled or exceeded during 50 percent, 25 percent, 8 percent, and 2 percent of a stated time. Sound levels associated with the L_2 and L_8 typically describe transient or short-term events, while levels associated with the L_{50} describe the steady state (or median) noise conditions. While the L_{50} describes the median noise levels occurring 50 percent of the time, the L_{eq} accounts for the total energy (average) observed for the entire hour. Therefore, the L_{eq} noise descriptor is generally 1-2 dBA higher than the L_{50} noise level.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Chino relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to

as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (6)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (8)

2.3.3 ATMOSPHERIC EFFECTS

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (6)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an “out of sight, out of mind” effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (8)

2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept is known as the source-path-receptor concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (8)

2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (9)

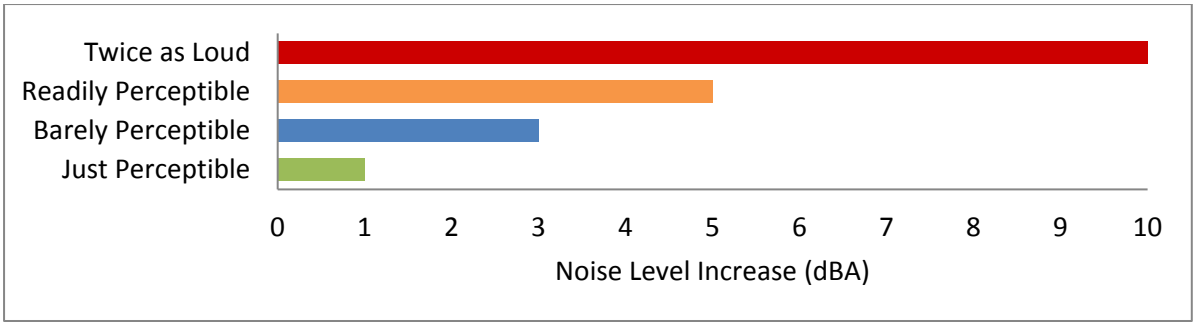
2.7 COMMUNITY RESPONSE TO NOISE

Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon everyone's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (10) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (10) Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. An increase or decrease of 1 dBA cannot be perceived except in carefully controlled laboratory experiments, a change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (8)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 EXPOSURE TO HIGH NOISE LEVELS

The Occupational Safety and Health Administration (OSHA) sets legal limits on noise exposure in the workplace. The permissible exposure limit (PEL) for a worker over an eight-hour day is 90 dBA. The OSHA standard uses a 5 dBA exchange rate. This means that when the noise level is increased by 5 dBA, the amount of time a person can be exposed to a certain noise level to receive the same dose is cut in half. The National Institute for Occupational Safety and Health (NIOSH) has recommended that all worker exposures to noise should be controlled below a level equivalent to 85 dBA for eight hours to minimize occupational noise induced hearing loss. NIOSH also recommends a 3 dBA exchange rate so that every increase by 3 dBA doubles the amount of the noise and halves the recommended amount of exposure time. (11)

OSHA has implemented requirements to protect all workers in general industry (e.g. the manufacturing and the service sectors) for employers to implement a Hearing Conservation Program where workers are exposed to a time weighted average noise level of 85 dBA or higher over an eight-hour work shift. Hearing Conservation Programs require employers to measure noise levels, provide free annual hearing exams and free hearing protection, provide training, and conduct evaluations of the adequacy of the hearing protectors in use unless changes to tools, equipment and schedules are made so that they are less noisy and worker exposure to noise is less than the 85 dBA. This noise study does not evaluate the noise exposure of workers within a project or construction site based on CEQA requirements, and instead, evaluates Project-related operational and construction noise levels at the nearby sensitive receiver locations in the Project study area. Further, periodic exposure to high noise levels in short duration, such as Project construction, is typically considered an annoyance and not impactful to human health. It would take several years of exposure to high noise levels to result in hearing impairment. (12)

2.9 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment* (3), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions.

As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings, but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal, and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (13) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*.

3.2 STATE OF CALIFORNIA GREEN BUILDING STANDARDS CODE

The 2014 State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. (14) These noise standards are applied to new construction in California for controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available and the noise level exceeds 65 dBA L_{eq} for any hour of operation, a wall and roof-ceiling combined STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

3.3 CITY OF CHINO GENERAL PLAN NOISE ELEMENT

The City of Chino has adopted a Noise Element of the General Plan (15) to minimize problems from intrusive sound and to ensure that development does not expose people to unacceptable noise levels. The Noise Element specifies the maximum exterior and interior noise levels for new developments impacted by transportation noise sources such as arterial roads, freeways, airports, and railroads. In addition, the Noise Element identifies noise polices designed to protect, create, and maintain an environment free from noise that may jeopardize the health or

welfare of sensitive receivers, or degrade quality of life. To protect Chino residents from unacceptable noise levels, the Noise Element contains the following three objectives:

N-1.1. Ensure appropriate exterior and interior noise levels for existing and new land uses;
N-1.2 Reduce noise impacts from transportation;
N-1.3 Control sources of construction noise.

The noise policies specified in the City of Chino Noise Element provide the guidelines necessary to satisfy these objectives. To ensure the appropriate exterior and interior noise levels for existing and new land uses (N-1.1), Table N-3 of the City of Chino General Plan Noise Element, shown on Exhibit 3-A, identifies a maximum allowable exterior noise level of 65 dBA CNEL and an interior noise level limit of 45 dBA CNEL for new residential developments impacted by transportation noise sources such as arterial roads, freeways, airports, railroads, and warehousing uses. For industrial land uses, such as manufacturing and warehousing, the City of Chino has established an interior noise level standard of 65 dBA CNEL. The Noise Element also provides several policies to reduce noise impacts from transportation (N-1.2) that includes the use of street and right-of-way design, roadway alignment, noise barriers, and pavement surface treatments. To control sources of construction noise (N-1.3), the Noise Element requires a noise monitoring plan and limits all construction activity near noise-sensitive land uses to the daylight hours of 7:00 a.m. to 7:00 p.m. In addition, several construction noise control measures are prescribed to minimize the construction noise impacts.

ADJACENT JURISDICTIONS

The City of Chino residential exterior noise level standard for transportation noise sources of 65 dBA CNEL is generally consistent with the adjacent jurisdictional guidelines of the City of Ontario and City of Eastvale, as indicated in The Ontario Plan Safety Section on Noise Hazards (Table LU-7) and Table N-3 of the City of Eastvale General Plan Noise Element, respectively, which identify exterior noise levels ranging from 60 to 70 dBA CNEL as acceptable for residential uses, but do not identify specific exterior transportation noise level standards. As such, this noise study relies on the 65 dBA CNEL City of Chino residential exterior noise level standard for transportation noise sources when evaluating Project-related off-site traffic noise level increases at noise-sensitive land uses. (16) (17) In addition, the guidelines of the City of Ontario and City of Eastvale, as indicated in The Ontario Plan Safety Section on Noise Hazards (Table LU-7) and Table N-3 of the City of Eastvale General Plan Noise Element, respectively, also identify 70 dBA CNEL as *normally acceptable* for non-noise-sensitive uses, such as industrial.

EXHIBIT 3-A: CITY OF CHINO INTERIOR AND EXTERIOR NOISE STANDARDS

Land Use Category	Uses	Energy Average L_{dn} Interior[a]	Energy Average L_{dn} Exterior[b]
Residential	Single-family, duplex, multi-family	45[c]	65
	Mobile home	---	65[d]
Commercial, Industrial, Institutional	Hotel, motel, transient lodging	45	65
	Commercial retail, bank, restaurant	55	---
	Office building, research and development, professional offices, City office building	50	---
	Amphitheatre, concert hall, auditorium, meeting hall	45	---
	Gymnasium (multipurpose)	50	---
	Sports club	55	---
	Manufacturing, warehousing, wholesale, utilities	65	---
	Movie theaters	45	---
Institutional	Hospital, schools, classroom	45	65
	Church, library	45	---
Open Space	Parks	---	65

[a] Indoor environment excluding: bathrooms, toilets, closets, corridors.

[b] Outdoor environment limited to: private yard of single-family or multi-family private patio or balcony which is served by a means of exit from inside, mobile home park, hospital patio, park's picnic area, school's playground, and hotel and motel recreation area.

[c] Noise level requirement with closed windows. Mechanical ventilation system or other means of natural ventilation shall be provided per the California Building Code.

[d] Exterior noise level should be such that interior noise levels will not exceed 45 dB L_{dn}.

Source: City of Chino General Plan Noise Element, Table N-3.

3.4 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the Altitude Business Centre Project, stationary-source (operational) noise such as the expected roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity are typically evaluated against standards established under a City's Municipal Code.

The City of Chino Noise Ordinance included in the Municipal Code (Chapter 9.40) establishes the maximum permissible noise level that may intrude into a neighbor's property. The Noise Ordinance (Section 9.40.040) establishes the exterior noise level criteria for residential properties affected by stationary noise sources. While the Municipal Code identifies noise zones for commercial (Zone II), manufacturing and industrial properties (Zone III), it only establishes exterior noise standards for residential property (Section 9.40.030). For residential properties (Noise Zone 1), the exterior noise level shall not exceed 55 dBA during daytime hours (7:00 a.m. to 10:00 p.m.) and shall not exceed 50 dBA during the nighttime hours (10:00 p.m. to 7:00 a.m.) for more than 30 minutes in any hour. (18) These standards shall apply for a cumulative period of 30 minutes in any hour, as well as plus 5 dBA cannot be exceeded for a cumulative period of more than 15 minutes in any hour, or the standard plus 10 dBA for a cumulative period of more than 5 minutes in any hour, or the standard plus 15 dBA for a cumulative period of more than 1 minute in any hour, or the standard plus 20 dBA for any period of time. The City of Chino Municipal Code operational noise level standards are shown on Table 3-1 and included in Appendix 3.1.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

City	Land Use	Time Period	Exterior Noise Level Standards (dBA)[2]				
			L_{50} (30 Mins)	L_{25} (15 Mins)	L_8 (5 Mins)	L_2 (1 Min)	Lmax (Anytime)
Chino[1]	Residential	Daytime	55	60	65	70	75
		Nighttime	50	55	60	65	70

[1] Source: Section9.40.040 of the City of Chino Municipal Code (Appendix 3.1).
[2] The percent noise level is the level exceeded "n" percent of the time during the measurement period. L_{25} is the noise level exceeded 25% of the time.
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

3.5 CONSTRUCTION NOISE STANDARDS

To analyze noise impacts originating from the construction of the Altitude Business Centre, noise from construction activities are typically evaluated against standards established under a City's Municipal Code. The Municipal Code noise standards for construction are described below for the City of Chino to determine the potential noise impacts at receivers within each jurisdiction. The construction-related noise standards for each City are summarized in Table 3-2.

The City of Chino has set restrictions to control noise impacts associated with construction activities throughout the City. Section 9.40.060(D) of the City's Noise Ordinance indicates that noise sources associated with construction, repair, remodeling, or grading of any real property, are exempt from the provisions of the noise ordinance, provided the construction activities take place between the hours of 7:00 a.m. and 8:00 p.m. Monday through Saturday, with no construction allowed on Sundays and Federal holidays (Section 15.44.030), and provided the noise levels exceeding 65 dBA L_{50} when measured on residential property do not endanger the public health, welfare and safety. (18) If construction activities occur outside of the permitted hours, then construction activity is required to be in compliance with the City's Municipal Code.

Although construction noise may not pose a health risk or damage human hearing, it has the potential to adversely affect people's quality of life. Noise annoys, awakens, angers, and frustrates noise-sensitive individuals. It disrupts communication and affects performance capabilities. Noise is one of the biological stressors associated with everyday life. Thus, the numerous effects of noise combine to detract from the quality of people's lives and the environment. In addition, acceptance of temporary construction noise varies with the individual. For this reason, and to present a conservative evaluation of construction noise effects in this report, the numerical noise standard of 65 dBA (with higher noise level allowances for short bursts of louder noise) established in the City of Chino Municipal Code, Section 9.40.060(D) *Special Provisions*, is used in this analysis to determine the significance of construction noise on noise-sensitive receivers.

The reference construction noise limit of 65 dBA L_{eq} provides an acceptable numerical threshold for determining the relative significance of Project construction noise levels at nearby residential receivers. The construction noise standards are shown on Table 3-2. Note that pursuant to the City of Chino Municipal Code, Section 9.40.060(D), the noise limit of 65 dBA is the noise standard for a cumulative period of more than thirty minutes in any hour (L_{50}). In addition, the Municipal Code allows for short bursts or periods of increased construction-related noise as follows:

- 70 dBA for a cumulative period of no more than fifteen minutes in any hour (L_{25});
- 75 dBA for a cumulative period of no more than five minutes in any hour (L_8);
- 80 dBA for a cumulative period of more than one minute in any hour (L_2);
- Noise levels greater than 85 dBA experienced at a sensitive receiver for any period (L_{max}).

For the purposes of this analysis, the 65 dBA L_{eq} threshold is used to represent a single numerical average threshold to assess the potential construction noise level impacts at nearby sensitive receivers. While the L_{50} describes the median noise levels occurring 50 percent of the time, the L_{eq} accounts for the total energy (average) observed for the entire hour during construction activities.

TABLE 3-2: CONSTRUCTION NOISE STANDARDS

City	Permitted Hours of Construction Activity	Construction Noise Level Standard (dBA L_{eq})
Chino[1]	7:00 a.m. to 8:00 p.m. Monday through Friday, not allowed on Sundays or Federal Holidays.	65

[1] Source: Section9.40.060 of the City of Chino Municipal Code (Appendix 3.1).

3.6 VIBRATION STANDARDS

To analyze vibration impacts originating from the operation and construction of the Altitude Business Centre, vibration-generating activities are typically evaluated against standards established under a City's Municipal Code. The Municipal Code vibration standards are described below for the City of Chino to determine the potential vibration impacts at sensitive receiver locations. The vibration standards are summarized on Table 3-3.

OPERATIONAL-SOURCE VIBRATION STANDARDS

City of Chino Noise Ordinance Section 9.40.110 - *Vibration*, states in pertinent part: *it is unlawful for any person to create, maintain or cause any ground vibration which is perceptible without instruments at any point on any affected property adjoining the property on which the vibration source is located*. *For the purpose of this chapter, the perception threshold shall be presumed to be more than 0.05 inches per second (root mean square–RMS) vertical velocity*. (18)

CONSTRUCTION-SOURCE VIBRATION STANDARDS

The City of Chino Noise Ordinance Section 9.40.060(D) states that vibration created by construction activities is exempt from provisions of the Ordinance, if any construction-source vibration does not endanger the public health, welfare, and safety. Therefore, to determine if the vibration levels due to construction will endanger the public health, welfare, and safety of nearby sensitive receiver locations, the operational vibration level standard of 0.05 inches per second (RMS) is used.

TABLE 3-3: VIBRATION STANDARDS

City	Root-Mean-Square Velocity (in/sec)
Chino[1]	0.05

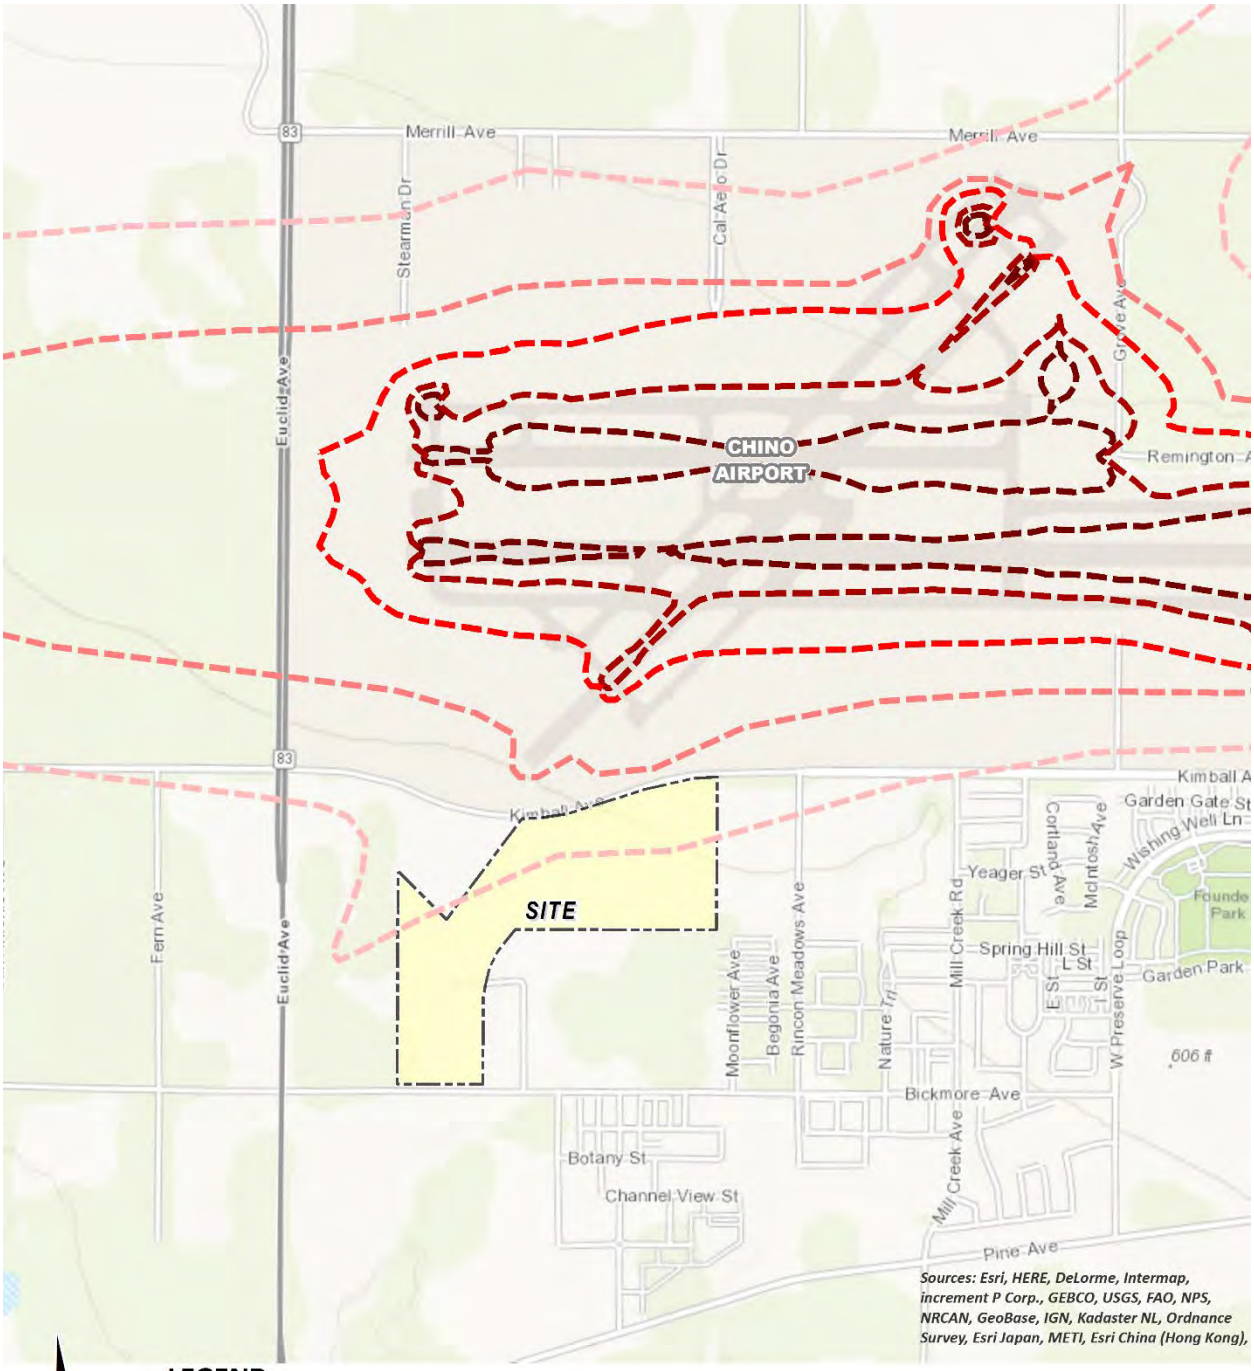
3.7 CHINO AIRPORT LAND USE COMPATIBILITY

The *Chino Airport Master Plan*, (19) prepared by the County of San Bernardino, identifies noise compatibility policies based on the *Chino Airport Comprehensive Land Use Plan* (ACLUP). (20) The ACLUP establishes threshold for aircraft noise exposure for new developments. The *Chino Airport Master Plan* shows the 65 dBA CNEL noise contour boundaries for Year 2009, 2015, and 2030 conditions. Based on Year 2030 conditions, the 55 dBA CNEL noise contour extends into the Project site boundaries, as shown on Exhibit 3-B. Table 2B of the ALUCP indicates that exterior noise levels of up to 65 dBA CNEL at industrial uses, such as the Project, are considered *normally acceptable*, and *slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities.* (20) Therefore, since the Project land use is considered *normally acceptable,* no exterior or interior noise mitigation is required, and the impacts due to aircraft noise will be *less than significant*. No further analysis is required or included in this noise study for the Chino Airport-related noise levels.

EXHIBIT 3-B: CHINO AIRPORT YEAR 2030 NOISE CONTOURS



Sources: Chino Airport Master Plan, Exhibit B4 and the Riverside County Airport Land Use Compatibility Plan, Map CH-3.

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

B. Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels.

C. A substantial permanent increase in ambient noise levels in the Project vicinity above existing levels without the proposed Project; or

D. A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above noise levels existing without the proposed Project.

E. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels.

F. For a project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

While the CEQA Guidelines and the City of Chino General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts under CEQA Guideline A, they do not define the levels at which increases are considered substantial for use under Guidelines B, C, and D. CEQA Guidelines E and F apply to nearby public and private airports, if any, and the Project's land use compatibility. The Project site is located approximately 450 feet south of Chino Airport. Based on Year 2030 conditions, the 55 dBA CNEL noise contour extends into the Project site boundaries, as previously shown on Exhibit 3-B. Table 2B of the ALUCP indicates that exterior noise levels of up to 65 dBA CNEL at industrial uses, such as the Project, are considered *normally acceptable*, and *slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities.* (20) Therefore, since the Project land use is considered *normally acceptable,* no exterior or interior noise mitigation is required, and the impacts due to aircraft noise will be *less than significant*. Further, no private airstrips are near the Project site. As such, the Project would not be exposed to substantial noise from aircraft overflights. Accordingly, people at the Project site would not be exposed to excessive noise levels from nearby airport operations, and therefore, impacts are considered *less than significant,* and no further noise analysis is conducted in relation to Guidelines E and F.

4.1 NOISE-SENSITIVE RECEIVERS

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing ambient noise levels, and the location of noise-sensitive receivers to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (21)

Unfortunately, there is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. The Federal Interagency Committee on Noise (FICON) (22) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (i.e., CNEL).

For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, for this analysis, FICON identifies a *readily perceptible* 5 dBA or greater project-related noise level increase is considered a significant impact when the noise criteria for a given land use is exceeded. Per FICON, in areas where the without project noise levels range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. Table 4-1 below provides a summary of the potential noise impact significance criteria, based on guidance from FICON.

TABLE 4-1: SIGNIFICANCE OF NOISE IMPACTS AT NOISE-SENSITIVE RECEIVERS

Without Project Noise Level	Potential Significant Impact
< 60 dBA	5 dBA or more
60 - 65 dBA	3 dBA or more
> 65 dBA	1.5 dBA or more

Federal Interagency Committee on Noise (FICON), 1992.

4.2 NON-NOISE-SENSITIVE RECEIVERS

Since the City of Chino General Plan Noise Element does not identify criteria to assess the impacts associated with exterior off-site transportation-related noise impacts at the Project land use, the OPR land use/noise compatibility criteria, found in Figure 2 of the *General Plan Guidelines, Appendix C: Noise Element Guidelines* is used to determine potential impacts at adjacent land uses. The *normally acceptable* exterior noise level for non-noise-sensitive land use, such as industrial use, is 70 dBA CNEL. Noise levels greater than 70 dBA CNEL are considered *conditionally acceptable* per the *Land Use Compatibility Criteria*. (13) This is consistent with the adjacent jurisdictional guidelines of the City of Ontario and City of Eastvale, as indicated in The Ontario Plan Safety Section on Noise Hazards (Table LU-7) and Table N-3 of the City of Eastvale General Plan Noise Element, respectively, which also identify 70 dBA CNEL as *normally acceptable* for industrial uses. . (16) (17)

To determine if Project-related traffic noise level increases are significant at off-site non-noise-sensitive land uses, a *readily perceptible* 5 dBA and *barely perceptible* 3 dBA criteria are used. When the without Project noise levels at the non-noise-sensitive land uses are below the *normally acceptable* 70 dBA CNEL compatibility criteria, a *readily perceptible* 5 dBA or greater noise level increase is considered a significant impact. When the without Project noise levels are greater than the *normally acceptable* 70 dBA CNEL land use compatibility criteria, a *barely perceptible* 3 dBA or greater noise level increase is considered a significant impact since the noise level criteria is already exceeded. The noise level increases used to determine significant impacts for non-noise-sensitive land uses is generally consistent with the FICON noise level increase thresholds for noise-sensitive land uses but instead rely on the OPR land use/noise compatibility criteria, found in Figure 2 of the *General Plan Guidelines, Appendix C: Noise Element Guidelines normally acceptable* 70 dBA CNEL exterior noise level criteria.

4.3 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-2 shows the significance criteria summary matrix.

OFF-SITE TRAFFIC NOISE

- When the noise levels at existing and future noise-sensitive land uses (e.g. residential, etc.):
    - are less than 60 dBA CNEL and the Project creates a *readily perceptible* 5 dBA CNEL or greater Project-related noise level increase; or
    - range from 60 to 65 dBA CNEL and the Project creates a *barely perceptible* 3 dBA CNEL or greater Project-related noise level increase; or
    - already exceed 65 dBA CNEL, and the Project creates a community noise level impact of greater than 1.5 dBA CNEL (FICON, 1992).
- When the noise levels at existing and future non-noise-sensitive land uses (e.g. industrial, etc.):
    - are less than the OPR General Plan Guidelines, Figure 2, *normally acceptable* 70 dBA and the Project creates a *readily perceptible* 5 dBA or greater Project-related noise level increase; or

- are greater than the OPR General Plan Guidelines, Figure 2, *normally acceptable* 70 dBA and the Project creates a *barely perceptible* 3 dBA or greater Project-related noise level increase.

OPERATIONAL NOISE

- If Project-related operational (stationary source) noise levels exceed the exterior 55 dBA L_{50} daytime or 50 dBA L_{50} nighttime noise level standards for sensitive residential land uses. These standards shall not be exceeded for a cumulative period of 30 minutes (L_{50}), or plus 5 dBA cannot be exceeded for a cumulative period of more than 15 minutes (L_{25}) in any hour, or the standard plus 10 dBA for a cumulative period of more than 5 minutes (L_8) in any hour, or the standard plus 15 dBA for a cumulative period of more than 1 minute (L_2) in any hour, or the standard plus 20 dBA at any time (Lmax) (City of Chino Municipal Code, Section 9.40.040); or
- If the existing ambient noise levels at the nearby noise-sensitive receivers near the Project site:
  - are less than 60 dBA L_{50} and the Project creates a *readily perceptible* 5 dBA L_{50} or greater Project-related noise level increase; or
  - range from 60 to 65 dBA L_{50} and the Project creates a *barely perceptible* 3 dBA L_{50} or greater Project-related noise level increase; or
  - already exceed 65 dBA L_{50} and the Project creates a community noise level impact of greater than 1.5 dBA L_{50} (FICON, 1992).
- If long-term Project generated operational vibration levels exceed the vibration standard of 0.05 inch/sec RMS at noise-sensitive receiver locations (City of Chino Municipal Code, Section 9.40.110).

CONSTRUCTION NOISE AND VIBRATION

- If Project-related construction activities:
  - occur at any time other than the permitted hours of 7:00 a.m. to 8:00 p.m. Monday through Friday, with no activity allowed on Sundays or Federal Holidays and exceed the Municipal Code noise level standards (City of Chino Municipal Code, Section 9.40.060(D)); or
  - create noise levels during the permitted hours at sensitive residential receivers in the which exceed the construction noise level limit of 65 dBA L_{eq} at nearby sensitive receiver locations (City of Chino Municipal Code, Section 9.40.060(D)).
- If short-term project generated construction source vibration levels could exceed the vibration standard of 0.05 inch/sec RMS at noise-sensitive receiver locations (City of Chino Municipal Code, Section 9.40.110).

TABLE 4-2: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Off-Site	Noise-Sensitive[1]	If ambient is < 60 dBA CNEL	≥ 5 dBA CNEL Project increase	
		If ambient is 60 - 65 dBA CNEL	≥ 3 dBA CNEL Project increase	
		If ambient is > 65 dBA CNEL	≥ 1.5 dBA CNEL Project increase	
	Non-Noise-Sensitive[2]	if ambient is < 70 dBA CNEL	≥ 5 dBA CNEL Project increase	
		if ambient is > 70 dBA CNEL	≥ 3 dBA CNEL Project increase	
Operational Noise & Vibration	Noise-Sensitive[3]	≥ 30 Minutes L_{50}	55	50
		≥ 15 Minutes L_{25}	60	55
		≥ 5 Minutes L_8	65	60
		≥ 1 Minute L_2	70	65
		Anytime L_{max}	75	70
		if ambient is < 60 dBA L_{so}[1]	≥ 5 dBA L_{50} Project increase	
		if ambient is 60 - 65 dBA L_{so}[1]	≥ 3 dBA L_{50} Project increase	
		if ambient is > 65 dBA L_{so}[1]	≥ 1.5 dBA L_{50} Project increase	
		Vibration Level Threshold[4]	0.05 in/sec RMS	n/a
Construction Noise & Vibration	Noise-Sensitive	Permitted hours of 7:00 a.m. to 8:00 p.m. Monday through Friday, not allowed on Sundays or Federal Holidays.[5]		
		Noise Level Threshold[6]	65 dBA L_{eq}	
		Vibration Level Threshold[4]	0.05 in/sec RMS	n/a

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at eight locations in the Project study area. The measurement locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Wednesday, June 14th, 2017. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (23)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (6) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (3)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (3) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels

and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average median sound levels (L_{50}). The median sound level (L_{50}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

- Location L1 represents the noise levels east of the Project site on Kimball Avenue near future residential homes (currently under construction). The noise level measurements collected show an overall 24-hour exterior noise level of 61.9 dBA CNEL. The median noise levels measured at location L1 ranged from 49.0 to 55.0 dBA L_{50} during the daytime hours and from 42.0 to 54.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 52.3 dBA L_{50} with an average nighttime noise level of 46.8 dBA L_{50}.
- Location L2 represents the noise levels east of the Project site on Mill Creek Road near existing residential homes. The noise level measurements collected show an overall 24-hour exterior noise level of 64.6 dBA CNEL. The median noise levels measured at location L2 ranged from 46.0 to 52.0 dBA L_{50} during the daytime hours and from 41.0 to 50.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 49.4 dBA L_{50} with an average nighttime noise level of 45.3 dBA L_{50}.
- Location L3 represents the noise levels east of the Project site in an existing residential community on Begonia Avenue. The 24-hour CNEL indicates that the overall exterior noise level is 57.6 dBA CNEL. At location L3 the background ambient noise levels ranged from 44.0 to 50.0 dBA L_{50} during the daytime hours to levels of 44.0 to 49.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 47.1 dBA L_{50} with an average nighttime noise level of 45.9 dBA L_{50}.
- Located southeast of the Project site, location L4 represents the noise levels on Bickmore Avenue near existing and future residential homes. The noise level measurements collected show an overall 24-hour exterior noise level of 66.2 dBA CNEL. The median noise levels measured at location L4 ranged from 45.0 to 60.0 dBA L_{50} during the daytime hours and from 41.0 to 59.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 51.9 dBA L_{50} with an average nighttime noise level of 46.1 dBA L_{50}.
- Location L5 represents the noise levels south of the Project site on Channel View Street near an existing residential community. The 24-hour CNEL indicates that the overall exterior noise level is 56.9 dBA CNEL. At location L5 the background ambient noise levels ranged from 45.0 to 50.0 dBA L_{50} during the daytime hours to levels of 42.0 to 49.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 47.6 dBA L_{50} with an average nighttime noise level of 44.7 dBA L_{50}.
- Location L6 represents the noise levels at the southwest corner of the Project site on Bickmore Avenue near existing agricultural uses. The noise level measurements collected show an overall 24-hour exterior noise level of 64.3 dBA CNEL. The median noise levels measured at location L6 ranged from 47.0 to 58.0 dBA L_{50} during the daytime hours and from 43.0 to 58.0

dBA L_{50} during the nighttime hours. The daytime noise level was calculated at 52.0 dBA L_{50} with an average nighttime noise level of 49.1 dBA L_{50}.

- Location L7 represents the noise levels measured west of the Project site adjacent to and existing residential home and industrial uses. The noise level measurements collected show an overall 24-hour exterior noise level of 69.3 dBA CNEL. The median noise levels measured at location L7 ranged from 53.0 to 62.0 dBA L_{50} during the daytime hours and from 53.0 to 62.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 58.5 dBA L_{50} with an average nighttime noise level of 56.0 dBA L_{50}.
- Location L8 represents the noise levels north of the Project site on Kimball Avenue near an existing fire station, south of Chino Airport. The 24-hour CNEL indicates that the overall exterior noise level is 78.3 dBA CNEL. At location L8 the background ambient noise levels ranged from 61.0 to 73.0 dBA L_{50} during the daytime hours to levels of 45.0 to 74.0 dBA L_{50} during the nighttime hours. The average daytime noise level was calculated at 67.5 dBA L_{50} with an average nighttime noise level of 57.0 dBA L_{50}.

Table 5-1 provides the noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all median (L_{50}) noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, energy average (L_{eq}), L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with the existing transportation network, including aircraft flyovers from Chino Airport. This also includes the auto and heavy truck activities on study area roadway segments near the noise level measurement locations. The 24-hour existing noise level measurement results are shown on Table 5-1.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Distance to Project Boundary (Feet)	Description	Median Average Noise Level (dBA L_{50})[2]		CNEL
			Daytime	Nighttime	
L1	610'	Located east of the Project site on Kimball Avenue near future residential homes (currently under construction).	52.3	46.8	61.9
L2	1,950'	Located east of the Project site on Mill Creek Road near existing residential homes.	49.4	45.3	64.6
L3	460'	Located east of the Project site in an existing residential community on Begonia Avenue.	47.1	45.9	57.6
L4	1,290'	Located southeast of the Project site on Bickmore Avenue near existing and future residential homes.	51.9	46.1	66.2
L5	1,825'	Located south of the Project site on Channel View Street near an existing residential community.	47.6	44.7	56.9
L6	0'	Located at the southwest corner of the Project site on Bickmore Avenue near existing agricultural uses.	52.0	49.1	64.3
L7	1,090'	Located west of the Project site adjacent to and existing residential home and industrial uses.	58.5	56.0	69.3
L8	80'	Located north of the Project site on Kimball Avenue near an existing fire station, south of Chino Airport.	67.5	57.0	78.3

[1] See Exhibit 5-A for the noise level measurement locations.
[2] The long-term 24-hour measurement worksheets are included in Appendix 5.2.
"Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.

6 METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The expected roadway noise level increases from vehicular traffic were calculated by Urban Crossroads, Inc. using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (24) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (25) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period. Research conducted by Caltrans has shown that the use of soft site conditions is appropriate for the application of the FHWA traffic noise prediction model used in this analysis. (26)

6.2 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the 42 study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications per the City of Chino General Plan Circulation Element, and the posted vehicle speeds. The ADT volumes used in this study are presented on Tables 6-2 to 6-4, and are based on the *Altitude Business Centre Traffic Impact Analysis* prepared by Urban Crossroads, Inc., for the following traffic scenarios: Existing, Opening Year 2018, Opening Year 2019, Opening Year 2020, Horizon Year 2040 Without Limonite Extension, and Horizon Year 2040 With Limonite Extension conditions. (2)

[1] Source: Altitude Business Centre Traffic Impact Analysis, Urban Crossroads, Inc., August 2017.
Note: Segments 37 to 42 are only analyzed under Horizon Year 2040 conditions consistent with the Traffic Impact Analysis based on the construction of the extension of Limonite Avenue.

Per the *Altitude Business Centre Traffic Impact Analysis* prepared by Urban Crossroads, Inc. the Project is expected to generate a net total of approximately 7,496 trip-ends per day (actual vehicles) and includes 1,695 truck trip-ends per day from the proposed buildings within the Project site. (2) This noise study relies on the net Project trips (as opposed to the passenger car equivalents) to accurately account for the effect of individual truck trips on the study area roadway network.

To quantify the off-site noise levels, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related truck trips increases the percentage of heavy trucks in the vehicle mix. This approach recognizes that the FHWA noise prediction model is significantly influenced by the number of heavy trucks in the vehicle mix.

Table 6-5 provides the time of day (daytime, evening, and nighttime) vehicle splits. The daily Project truck trip-ends were assigned to the individual off-site study area roadway segments based on the Project truck trip distribution percentages documented in the *Traffic Impact Analysis*. Using the Project truck trips in combination with the Project trip distribution, Urban Crossroads, Inc. calculated the number of additional Project truck trips and vehicle mix percentages for each of the study area roadway segments. Table 6-6 shows the traffic flow by vehicle type (vehicle mix) used for all without Project traffic scenarios, and Tables 6-7 to 6-14 show the vehicle mixes used for the with Project traffic scenarios.

TABLE 6-5: TIME OF DAY VEHICLE SPLITS

Vehicle Type	Time of Day Splits			Total of Time of Day Splits
	Daytime	Evening	Nighttime	
Autos	74.05%	12.61%	13.34%	100.00%
Medium Trucks	81.17%	5.38%	13.45%	100.00%
Heavy Trucks	82.13%	2.77%	15.11%	100.00%

Based on existing peak hour classification counts by vehicle type taken on 5/18/2016 at Central Avenue and El Prado Road (Altitude Business Centre Traffic Impact Analysis, Urban Crossroads, Inc., August 2017). Total of vehicle mix percentage values rounded to the nearest one-hundredth.
"Daytime" = 7:00 a.m. to 7:00 p.m.; "Evening" = 7:00 p.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

TABLE 6-6: WITHOUT PROJECT CONDITIONS VEHICLE MIX

Classification	Total % Traffic Flow			Total
	Autos	Medium Trucks	Heavy Trucks	
All Segments	91.30%	5.00%	3.70%	100.00%

Based on existing peak hour classification counts by vehicle type taken on 5/18/2016 at Central Avenue and El Prado Road (Altitude Business Centre Traffic Impact Analysis, Urban Crossroads, Inc., August 2017). Total of vehicle mix percentage values rounded to the nearest one-hundredth.

6.3 VIBRATION ASSESSMENT

This analysis focuses on the potential ground-borne vibration associated with vehicular traffic and construction activities. Ground-borne vibration levels from automobile traffic are generally overshadowed by vibration generated by heavy trucks that roll over the same uneven roadway surfaces. However, due to the rapid drop-off rate of ground-borne vibration and the short duration of the associated events, vehicular traffic-induced ground-borne vibration is rarely perceptible beyond the roadway right-of-way, and rarely results in vibration levels that cause damage to buildings in the vicinity.

However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 6-15. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 6-15: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089

7 OFF-SITE TRANSPORTATION NOISE IMPACTS

To assess the off-site transportation CNEL noise level impacts associated with the proposed Project, noise contours were developed based on the *Altitude Business Centre Traffic Impact Analysis*. (2) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

- Existing Without Project: This scenario refers to the existing present-day noise conditions, without the proposed Project. With Project conditions are evaluated as follows under existing conditions:
    - With Phase 1
    - With Phase 1 & 2
    - With Project Buildout
- Opening Year 2018 Without / With Project (Phase 1): This scenario below refers to the background noise conditions at future Year 2018 without and with the proposed Project plus ambient growth. This scenario corresponds to Year 2018 conditions, and includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Opening Year 2019 Without / With Project (Phase 1 & 2): This scenario below refers to the background noise conditions at future Year 2019 without and with the proposed Project plus ambient growth. This scenario corresponds to Year 2019 conditions, and includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Opening Year 2020 Without / With Project (Buildout): This scenario below refers to the background noise conditions at future Year 2020 without and with the proposed Project plus ambient growth. This scenario corresponds to Year 2020 conditions, and includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Horizon Year 2040 Without Limonite Extension Without / With Project: This scenario below refers to the background noise conditions at future Year 2040 without the Limonite Avenue Extension, and without and with the proposed Project plus ambient growth. This scenario corresponds to Year 2040 conditions, and includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Horizon Year 2040 With Limonite Extension Without / With Project: This scenario below refers to the background noise conditions at future Year 2040 with the Limonite Avenue Extension, and without and with the proposed Project plus ambient growth. This scenario corresponds to Year 2040 conditions, and includes all cumulative projects identified in the *Traffic Impact Analysis*.

7.1 TRAFFIC NOISE CONTOURS

To quantify the Project's operational traffic noise impacts on the surrounding areas, the changes in traffic noise levels on roadway segments surrounding the Project were calculated based on the changes in the average daily traffic volumes. Based on the noise impact significance criteria described in Section 4 and shown on Table 4-2, a potentially significant off-site traffic noise level impact occurs:

- When the noise levels at existing and future noise-sensitive land uses (e.g. residential, etc.):
    - are less than 60 dBA CNEL and the Project creates a *readily perceptible* 5 dBA CNEL or greater Project-related noise level increase; or
    - range from 60 to 65 dBA CNEL and the Project creates a *barely perceptible* 3 dBA CNEL or greater Project-related noise level increase; or
    - already exceed 65 dBA CNEL, and the Project creates a community noise level impact of greater than 1.5 dBA CNEL (FICON, 1992).
- When the noise levels at existing and future non-noise-sensitive land uses (e.g. industrial, etc.):
    - are less than the OPR General Plan Guidelines, Figure 2, *normally acceptable* 70 dBA and the Project creates a *readily perceptible* 5 dBA or greater Project-related noise level increase; or
    - are greater than the OPR General Plan Guidelines, Figure 2, *normally acceptable* 70 dBA and the Project creates a *barely perceptible* 3 dBA or greater Project-related noise level increase.

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not consider the effect of any existing noise barriers or topography that may attenuate ambient noise levels. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area. Tables 7-1 through 7-14 present a summary of the exterior traffic noise levels, without barrier attenuation, for the study area roadway segments analyzed from the without Project to the with Project conditions in each of the six timeframes: Existing, Opening Year 2018, Opening Year 2019, Opening Year 2020, Horizon Year 2040 Without Limonite Extension, and Horizon Year 2040 With Limonite Extension conditions. Appendix 7.1 includes a summary of the traffic noise level contours for each of the 14 traffic scenarios.

[1] Sources: City of Chino General Plan Land Use Designations, Figure LU-2, The Ontario Plan Land Use Plan, Exhibit LU-01, and the City of Eastvale General Plan Land Use Map.

[2] The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest adjacent land use.

"RW" = Location of the respective noise contour falls within the right-of-way of the road.

7.2 EXISTING CONDITIONS PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

To satisfy the CEQA Guidelines Section 15125(a), an analysis of existing traffic noise levels plus traffic noise generated by the proposed Project (E+P) has been included in this report. The analysis of existing traffic noise levels plus traffic noise generated by the proposed Project (E+P) scenario will not actually occur since the Project would not be fully constructed and operational until Opening Year 2020 conditions. Table 7-1 presents the Existing without Project conditions CNEL noise levels. The Existing without Project exterior noise levels are expected to range from 66.4 to 79.8 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography.

7.2.1 WITH PHASE 1 OFF-SITE TRAFFIC NOISE LEVEL CONDITIONS

Table 7-2 shows the Existing with Phase 1 conditions will range from 66.8 to 79.9 dBA CNEL. As shown on Table 7-15, Project Phase 1 will generate noise level increases ranging from 0.0 to 0.8 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to Project Phase 1 traffic-related noise level increases.

7.2.2 WITH PHASE 1 & 2 OFF-SITE TRAFFIC NOISE LEVEL CONDITIONS

Table 7-3 shows the Existing with Phase 1 & 2 conditions will range from 67.0 to 80.0 dBA CNEL. As shown on Table 7-16, Phase 1 & 2 traffic conditions will generate noise level increases ranging from 0.0 to 1.5 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to Project Phase 1 & 2 traffic-related noise level increases.

7.2.3 WITH PROJECT BUILDOUT OFF-SITE TRAFFIC NOISE LEVEL CONDITIONS

Table 7-4 shows the Existing with Project Buildout conditions will range from 67.0 to 80.2 dBA CNEL. As shown on Table 7-17, Project Buildout will generate noise level increases ranging from 0.0 to 2.2 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to Project Buildout traffic-related noise level increases.

[2] The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest adjacent land use.
[3] Significance Criteria (Section 4).

7.3 OPENING YEAR 2018 PHASE 1 TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-5 presents the Opening Year 2018 without Project conditions CNEL noise levels. The Opening Year 2018 without Project exterior noise levels are expected to range from 68.3 to 81.1 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-6 shows the unmitigated Opening Year 2018 with Project conditions will range from 68.3 to 81.3 dBA CNEL. As shown on Table 7-18 the Project will generate noise level increases of up to 0.5 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to unmitigated Project-related traffic under Opening Year 2018 Phase 1 conditions.

7.4 OPENING YEAR 2019 PHASE 1 & 2 TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-7 presents the Opening Year 2019 without Project conditions CNEL noise levels. The Opening Year 2019 without Project exterior noise levels are expected to range from 68.4 to 81.2 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-8 shows the unmitigated Opening Year 2019 with Project conditions will range from 68.4 to 81.5 dBA CNEL. As shown on Table 7-19, the Project will generate noise level increases of up to 1.1 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to unmitigated Project-related traffic under Opening Year 2019 Phase 1 & 2 conditions.

7.5 OPENING YEAR 2020 PROJECT BUILDOUT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-9 presents the Opening Year 2020 without Project conditions CNEL noise levels. The Opening Year 2020 without Project exterior noise levels are expected to range from 68.4 to 81.2 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-10 shows the unmitigated Opening Year 2020 with Project conditions will range from 68.5 to 81.8 dBA CNEL. As shown on Table 7-20, the Project will generate noise level increases of up to 1.7 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to unmitigated Project-related traffic under Opening Year 2020 Project Buildout conditions.

[3] Significance Criteria (Section 4).

7.6 HORIZON YEAR 2040 WITHOUT LIMONITE EXT. PROJECT TRAFFIC NOISE LEVELS

Table 7-11 presents the Horizon Year 2040 without Limonite Avenue Extension without Project conditions CNEL noise levels which are expected to range from 64.8 to 82.2 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-12 shows the unmitigated Horizon Year 2040 without Limonite Avenue Extension with Project conditions will range from 66.5 to 82.6 dBA CNEL. As shown on Table 7-21, the Project will generate noise level increases of up to 1.9 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to unmitigated Project-related traffic under Horizon Year 2040 without Limonite Extension with Project conditions.

7.7 HORIZON YEAR 2040 WITH LIMONITE EXT. PROJECT TRAFFIC NOISE LEVELS

Table 7-11 presents the Horizon Year 2040 with Limonite Avenue Extension without Project conditions CNEL noise levels which are expected to range from 67.6 to 82.2 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-12 shows the unmitigated Horizon Year 2040 with Limonite Avenue Extension with Project conditions will range from 67.7 to 82.6 dBA CNEL. As shown on Table 7-22, the Project will generate noise level increases of up to 1.7 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, land uses adjacent to the following roadway segments would experience *less than significant* noise level increases due to unmitigated Project-related traffic under Horizon Year 2040 with Limonite Extension with Project conditions.

8 SENSITIVE RECEIVER LOCATIONS

The following section presents a summary of the noise-sensitive receiver locations identified for evaluating Project-related operational and construction noise and vibration levels. To assess the potential for long-term operational and short-term construction noise impacts, the following seven sensitive receiver locations, as shown on Exhibit 8-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include: schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include: multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

The closest sensitive receiver is represented by location R1 where residential-designated land use is currently under construction at approximately 10 feet east of the Project site boundaries. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures.

R1: Located approximately 10 feet east of the Project site, R1 represents future residential homes currently under construction on Rincon Meadows Avenue. A 24-hour noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

R2: Location R2 represents the existing residential homes located east of the Project site at roughly 1,407 feet on Spring Hill Street. A 24-hour noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Location R3 represents the existing residential homes approximately 45 feet southeast of the Project site on Moonflower Avenue. A 24-hour noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

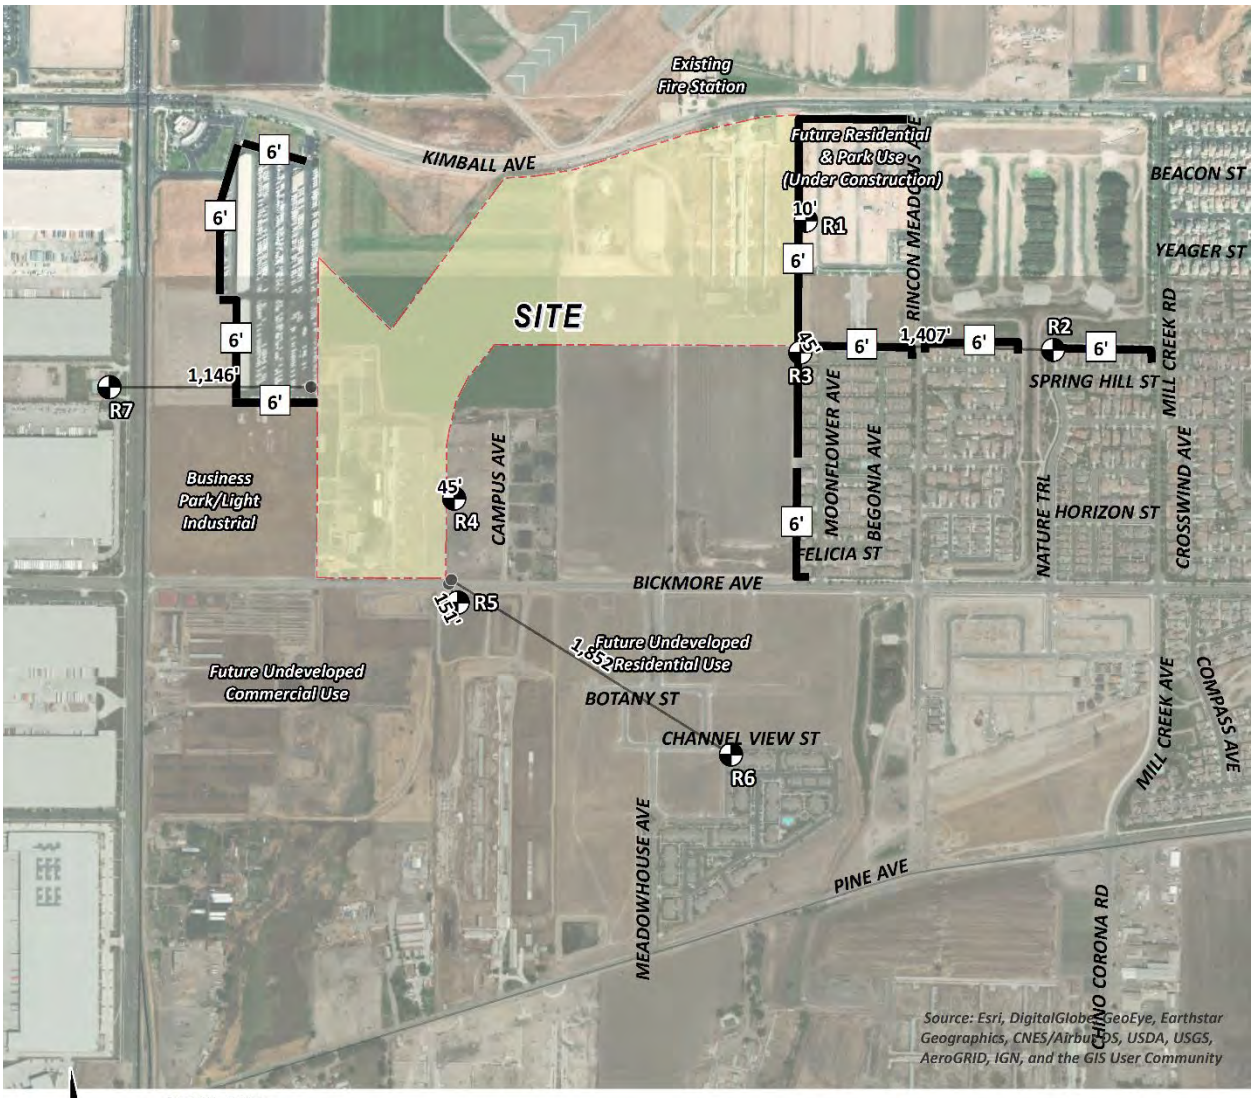
R4: Location R4 represents the future residential-designated land use, currently unoccupied, east of the Project site, across the future location of Mayhew Avenue.

R5: Located approximately 151 feet south of the Project site, R5 represents future residential-designated land use, currently unoccupied, on Bickmore Avenue. A 24-hour noise measurement was taken near this location, L6, to describe the existing ambient noise environment.

R6: Location R6 represents the existing residential homes located south of the Project site at roughly 1,852 feet on Channel View Street. A 24-hour noise measurement was taken near this location, L5, to describe the existing ambient noise environment.

R7: Location R7 represents the existing residential home located at approximately 1,146 feet west of the Project site on Euclid Avenue. A 24-hour noise measurement was taken near this location, L7, to describe the existing ambient noise environment.

EXHIBIT 8-A: SENSITIVE RECEIVER LOCATIONS



9 OPERATIONAL NOISE IMPACTS

This section analyzes the potential stationary-source operational noise impacts at the nearby receiver locations, identified in Section 8, resulting from operation of the proposed Altitude Business Centre Project. Exhibit 9-A identifies the representative receiver locations and noise source locations used to assess the operational noise levels.

9.1 OPERATIONAL NOISE SOURCES

At the time this noise analysis was prepared, the future tenants of the proposed Project were unknown. The on-site Project-related noise sources are expected to include: roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity. This noise analysis is intended to describe noise level impacts associated with the expected typical operational activities at the Project site.

9.2 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 9-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity all operating simultaneously. These noise level impacts will likely vary throughout the day.

9.2.1 ROOF-TOP AIR CONDITIONING UNITS

To assess the impacts created by the roof-top air conditioning units at the Project buildings, reference noise levels measurements were taken at the Santee Walmart on July 27, 2015. Located at 170 Town Center Parkway in the City of Santee, the noise level measurements describe a single mechanical roof-top air conditioning unit on the roof of an existing Walmart store. The reference noise level represents a Lennox SCA120 series 10-ton model packaged air conditioning unit. Using the uniform reference distance of 50 feet, the reference air conditioning unit noise level is 54.4 dBA L_{50}. The operating conditions of the reference noise level measurement reflect peak summer cooling requirements with measured temperatures approaching 96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. The roof-top air condition units were observed to operate the most during the daytime hours for a total of 39 minutes per hour. The noise attenuation provided by a parapet wall is not reflected in this reference noise level measurement.

9.2.2 TRUCK UNLOADING/DOCKING ACTIVITY

A short-term reference noise level measurement was collected on Wednesday, January 7, 2015, by Urban Crossroads, Inc. at the Motivational Fulfillment & Logistics Services distribution facility located at 6810 Bickmore Avenue in the City of Chino. The noise level measurement represents the typical weekday dry goods logistics warehouse operation in a single building, of roughly 285,000 square feet, with a loading dock area on the western side of the building façade. Up to ten trucks were observed in the loading dock area including a combination of track trailer semi-trucks, two-axle delivery trucks, and background forklift operations.

The unloading/docking activity noise level measurement was taken over a fifteen-minute period and represents multiple noise sources taken from the center of loading dock activities generating a reference noise level of 59.8 dBA L_{50} at a uniform reference distance of 50 feet. At this measurement location, the noise sources associated with employees unloading a docked truck container included the squeaking of the truck's shocks when weight was removed from the truck, employees playing music over a radio, as well as a forklift horn and backup alarm. In addition, during the noise level measurement a truck entered the loading dock area and proceeded to reverse and dock in a nearby loading bay, adding truck engine and air brakes noise.

9.2.3 PARKING LOT VEHICLE MOVEMENTS

To determine the noise levels associated with parking lot vehicle movements, Urban Crossroads collected reference noise level measurements over a 24-hour period on May 17, 2017 at the parking lot for the Panasonic Avionics Corporation in the City of Lake Forest. The peak hour of activity measured over the 24-hour noise level measurement period occurred between 12:00 p.m. to 1:00 p.m., or the typical lunch hour for employees working in the area. The measured reference noise level at 50 feet from parking lot vehicle movements was measured at 38.5 dBA L_{50}. The parking lot noise levels are mainly due to cars pulling in and out of spaces during peak lunch hour activity and employees talking. Noise associated with parking lot vehicle movements is expected to operate for the entire hour (60 minutes).

9.2.4 STORAGE (ROLL-UP DOOR) ACTIVITY

To describe the storage (roll-up door) activity at the self-storage use within the Project site, a reference noise level measurement was collected at the Storage Solutions Self Storage in the City of Irvine on October 31st, 2008. The reference noise level for a roll-up door is 52.6 dBA L_{50} at a uniform reference distance of 50 feet. It is expected that roll-up doors would be in the first floor of the Project buildings. Roll-up door activities are expected to occur for 60 minutes during daytime peak hour conditions.

TABLE 9-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source	Duration (h:mm:ss)	Distance From Source (Feet)	Noise Source Height (Feet)	Hourly Activity (Minutes)[5]	Noise Level (dBA L_{50})	
					@ Ref. Distance	@ 50 Feet
Roof-Top Air Conditioning Units[1]	96:00:00	5'	25'	39	74.4	54.4
Truck Unloading/Docking Activity[2]	00:15:00	30'	8'	60	64.2	59.8
Parking Lot Vehicle Movements[3]	01:00:00	10'	5'	60	49.0	38.5
Storage (Roll-Up Doors) Activity[4]	00:00:13	10'	4'	60	66.6	52.6

[1] As measured by Urban Crossroads, Inc. on 7/27/2015 at the Santee Walmart located at 170 Town Center Parkway.
[2] Reference noise level measurements were collected on 1/7/2015 from the existing operations of the Motivational Fulfillment & Logistics Services distribution facility located at 6810 Bickmore Avenue in the City of Chino.
[3] As measured by Urban Crossroads, Inc. on 5/17/2017 at the Panasonic Avionics Corporation parking lot in the City of Lake Forest.
[4] As measured by Urban Crossroads, Inc. on 10/31/2008 at the Storage Solutions Self Storage in the City of Irvine.
[5] Duration (minutes within the hour) of noise activity during peak hourly conditions.

9.3 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed Project operations that include roof-top air conditioning units, idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, parking lot vehicle movements, and self-storage activity, Urban Crossroads, Inc. calculated the operational source noise levels that are expected to be generated at the Project site and the Project-related noise level increases that would be experienced at each of the sensitive receiver locations. The operational noise level calculations, shown on Table 9-2, account for the distance attenuation provided due to geometric spreading when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. Hard site conditions are used in the operational noise analysis which result in noise levels that attenuate (or decrease) at a rate of 6 dBA for each doubling of distance from a point source. The basic noise attenuation equation shown below is used to calculate the distance attenuation based on a reference noise level (SPL_1):

$$SPL_2 = SPL_1 - 20\log(D_2/D_1)$$

Where SPL_2 is the resulting noise level after attenuation, SPL_1 is the source noise level, D_2 is the distance to the reference sound pressure level (SPL_1), and D_1 is the distance to the receiver location. Table 9-2 shows the individual operational noise levels of each noise source at each of the nearby sensitive receiver locations. As indicated on Table 9-2, the Project-only operational noise levels will range from 25.5 to 45.5 dBA L_{50}, 28.4 to 48.2 dBA L_{25}, 32.9 to 52.4 dBA L_8, 36.8 to 56.1 dBA L_2, and 41.8 to 61.1 dBA L_{max} at the sensitive receiver locations.

[1] See Exhibit 9-A for the receiver and noise source locations.
[2] Reference noise sources as shown on Table 9-1.
[3] Operational noise level calculations are provided in Appendix 9.2.

Table 9-3 presents a summary of the combined total Project-only operational noise level projections at the nearby sensitive receiver locations for a comparison with local jurisdiction exterior noise level standards. The Project operational noise levels at the nearby sensitive receiver locations are shown to range from 25.5 to 45.5 dBA L_{50}, 28.4 to 48.2 dBA L_{25}, 32.9 to 52.4 dBA L_8, 36.8 to 56.1 dBA L_2, and 41.8 to 61.1 dBA L_{max}. Based on the results of this analysis, the operational noise levels associated with the Altitude Business Centre will satisfy the operational exterior daytime and nighttime noise level standards at all nearby sensitive receiver locations. The operational noise level calculations are included in Appendix 9.1.

TABLE 9-3: UNMITIGATED OPERATIONAL NOISE LEVEL COMPLIANCE

Receiver Location[1]	Noise Level at Receiver Locations (dBA)[2]					Threshold Exceeded?[3]	
	L_{50} (30 mins)	L_{25} (15 mins)	L_8 (5 mins)	L_2 (1 min)	L_{max} (Anytime)	Daytime	Nighttime
Residential Standards	**55**	**60**	**65**	**70**	**75**	**Daytime**	
	50	**55**	**60**	**65**	**70**	**Nighttime**	
R1	42.9	45.5	49.7	53.3	58.6	No	No

R5	41.7	44.3	48.5	52.1	57.2	No	No
R6	28.3	31.1	35.3	39.0	44.0	No	No
R7	33.2	36.1	40.4	44.1	49.0	No	No

[1] See Exhibit 9-A for the receiver and noise source locations.
[2] Estimated Project operational noise levels as shown on Table 9-2.
[3] Do the estimated Project operational noise levels meet the operational noise level standards (Table 3-1)?
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

9.4 PROJECT OPERATIONAL NOISE LEVEL CONTRIBUTIONS

To describe the Project operational noise level contributions, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (6) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describe the Project noise level contributions to the existing ambient noise environment. Noise levels that would be experienced at receiver locations when

Project-source noise is added to the daytime and nighttime ambient conditions are presented on Tables 9-4 and 9-5, respectively.

As indicated on Tables 9-4 and 9-5, the Project will generate a daytime operational noise level increase of up to 1.4 dBA L_{50} and a nighttime operational noise level increase of up to 1.8 dBA L_{50} at the nearby receiver locations. Since the Project-related operational noise level contributions will satisfy the significance criteria discussed in Section 4, the increases at the sensitive receiver locations will be *less than significant*. On this basis, Project operational stationary-source noise would not result in a substantial temporary/periodic, or permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project, and impacts in these regards will be *less than significant*.

[6] The noise level increase expected with the addition of the proposed Project activities.
[7] Significance Criteria as defined in Section 4.

9.5 OPERATIONAL VIBRATION IMPACTS

To assess the potential vibration impacts from truck haul trips associated with operational activities the City of Chino threshold for vibration of 0.05 in/sec RMS is used, as previously shown on Table 3-2. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. Typical vibration levels for the Altitude Business Centre heavy truck activity at normal traffic speeds will approach 0.004 in/sec PPV and 0.003 in/sec RMS at 25 feet based on the FTA *Transit Noise Impact and Vibration Assessment.* (3) Trucks transiting on site will be travelling at very low speeds so it is expected that delivery truck vibration impacts at nearby homes will satisfy both the City of Chino vibration thresholds, and therefore, will be *less than significant*.

10 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term daytime and nighttime construction activities associated with the development of the Project. Exhibit 10-A shows the construction noise source locations in relation to the nearby sensitive receiver locations (R1 to R7) previously described in Section 8. However, since Project construction will include potential off-site roadway and utility improvements which extend beyond the Project site boundaries, as shown on Exhibit 10-A, this Section identifies three additional sensitive receiver locations (R8 to R10) for analysis adjacent to the off-site improvement areas of activity. Further, to present all Project-related construction noise and vibration levels, this Section analyzes all construction activity noise and vibration levels at both the previously identified receiver locations (R1 to R7 closest to the site), and the additional receiver locations identified herein (R8 to R10) adjacent to the potential off-site improvements.

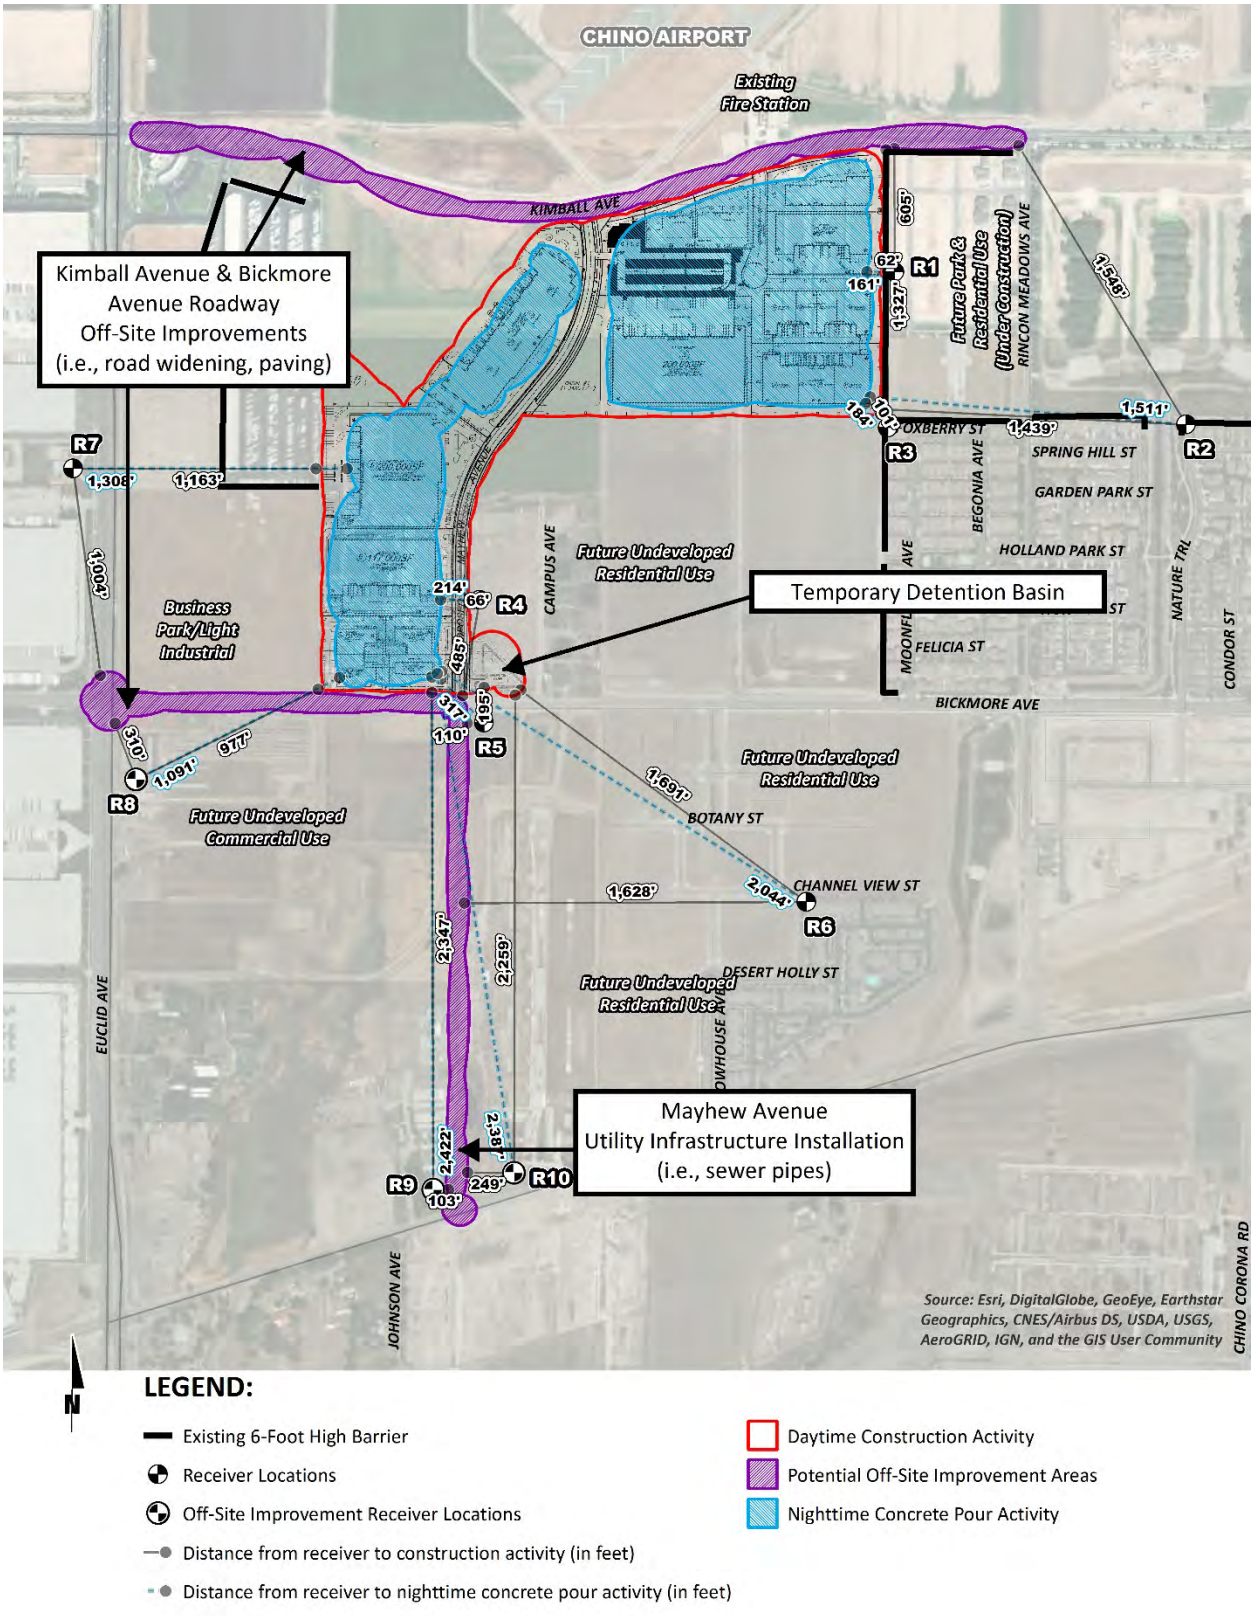
10.1 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. The number and mix of construction equipment is expected to occur in the following stages:

- Demolition
- Grading
- Building Construction
- Architectural Coating
- Paving

This construction noise analysis was prepared using reference noise level measurements taken by Urban Crossroads, Inc. to describe the typical construction activity noise levels for each stage of Project construction. The construction reference noise level measurements represent a list of typical construction activity noise levels. Noise levels generated by heavy construction equipment can range from approximately 68 dBA to more than 80 dBA when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver, and would be further reduced to 68 dBA at 200 feet from the source to the receiver. The construction stages used in this analysis are consistent with the *Altitude Business Centre Air Quality Impact Analysis* prepared by Urban Crossroads, Inc. (27)

EXHIBIT 10-A: CONSTRUCTION NOISE SOURCE LOCATIONS



10.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe the Project construction noise levels, measurements were collected for similar activities at several construction sites. Table 10-1 provides a summary of the 17-construction reference noise level measurements. Since the reference noise levels were collected at varying distances of 30 feet and 50 feet, all construction noise level measurements presented on Table 10-1 have been adjusted for consistency to describe a uniform reference distance of 50 feet.

TABLE 10-1: CONSTRUCTION REFERENCE NOISE LEVELS

ID	Noise Source	Reference Distance From Source (Feet)	Reference Noise Levels @ Reference Distance (dBA L_{eq})	Reference Noise Levels @ 50 Feet (dBA L_{eq})[7]

17	Forklift, Jackhammer, & Metal Truck Bed Loading	50'	67.9	67.9

[1] As measured by Urban Crossroads, Inc. on 10/14/15 at a business park construction site located at the northwest corner of Barranca Parkway and Alton Parkway in the City of Irvine.
[2] As measured by Urban Crossroads, Inc. on 10/20/15 at a construction site located in Rancho Mission Viejo.
[3] As measured by Urban Crossroads, Inc. on 10/20/15 at a residential construction site located in Rancho Mission Viejo.
[4] As measured by Urban Crossroads, Inc. on 10/30/15 during grading operations within an industrial construction site located in the City of Ontario.
[5] Reference noise level measurements were collected from a nighttime concrete pour at an industrial construction site, located at 27334 San Bernardino Avenue in the City of Redlands, between 1:00 a.m. to 2:00 a.m. on 7/1/15.
[6] As measured by Urban Crossroads, Inc. on 9/9/16 during the demolition of an existing paved parking lot at 41 Corporate Park in Irvine.
[7] Reference noise levels are calculated at 50 feet using a drop off rate of 6 dBA per doubling of distance (point source).

10.3 DAYTIME CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels, calculations of the daytime Project construction noise level impacts at the nearby sensitive receiver locations were completed. Tables 10-2 to 10-6 present the short-term daytime construction noise levels for each stage of construction. Table 10-7 provides a summary of the daytime construction noise levels by stage at the nearby noise-sensitive receiver locations. Based on the stages of construction, the noise impacts associated with the proposed Project are expected to create temporarily high noise levels at the nearby receiver locations. To assess the worst-case daytime construction noise levels, this analysis shows the highest noise impacts when the equipment with the highest reference noise level is operating at the closest point from primary construction activity to each receiver location.

TABLE 10-2: DEMOLITION EQUIPMENT NOISE LEVELS

[4] Calculated barrier attenuation from existing barriers and intervening structures in the Project study area (Appendix 10.1).

The daytime construction noise analysis shows that the highest construction noise levels will occur when construction activities take place at the closest point from primary Project construction activity to each of the nearby receiver locations. As shown on Table 10-7, the unmitigated daytime construction noise levels are expected to range from 45.8 to 77.2 dBA L_{eq} at the nearby receiver locations.

TABLE 10-7: UNMITIGATED DAYTIME CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Receiver Location	Distance to Receiver (Feet)	Daytime Construction Noise Levels (dBA L_{eq})

10.4 NIGHTTIME CONCRETE POUR NOISE ANALYSIS

Using the reference concrete pour activity construction equipment noise levels, calculations of the nighttime Project construction noise level impacts at the nearby sensitive receiver locations were completed. Table 10-8 presents the short-term nighttime construction noise levels at the noise receiver locations which are expected to range from 37.4 to 59.0 dBA L_{eq}. To assess the highest nighttime construction noise levels, this analysis shows the highest noise impacts when the equipment with the highest reference noise level is operating at the closest point from primary construction activity to each receiver location. Exhibit 10-A shows the distance from each receiver location to the nighttime concrete pour activity locations.

TABLE 10-8: NIGHTTIME CONCRETE POUR EQUIPMENT NOISE LEVELS

10.5 OFF-SITE IMPROVEMENT ACTIVITY NOISE ANALYSIS

Off-site Project-related construction includes roadway improvements on Kimball Avenue and Bickmore Avenue, such as road widening and paving activities, and utility improvements on Mayhew Avenue, such as sewer pipe installation. To present a conservative approach, the reference construction activity noise levels of both road widening and paving, and utility improvement activities are assumed to operate within all off-site improvement areas. Exhibit 10-A shows the potential off-site improvement activity areas and receiver locations. Table 10-9 shows the off-site improvement construction noise levels will range from 37.2 to 65.3 dBA L_{eq} at the nearby sensitive receiver locations.

TABLE 10-9: OFF-SITE IMPROVEMENT EQUIPMENT NOISE LEVELS

10.6 CONSTRUCTION NOISE THRESHOLDS OF SIGNIFICANCE

Table 10-10 shows the highest construction noise levels at the potentially impacted receiver locations from daytime, nighttime, and off-site improvement activities, respectively. As shown on Table 10-10, the daytime construction noise levels are expected to approach 77.2 dBA L_{eq} and will exceed the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at three of the 10 sensitive receiver locations: R1, and R3 to R5. Therefore, the unmitigated noise impact due to daytime Project construction is considered *potentially significant* at receiver locations R1, and R3 to R5 during daytime construction activities. All other

receiver locations will experience unmitigated *less than significant* noise impacts during daytime construction activities.

Nighttime concrete pour activity noise levels are shown to approach 59.0 dBA L_{eq} and will satisfy the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at all of the sensitive receiver locations. Therefore, the unmitigated noise impact due to nighttime Project construction is considered *less than significant*.

Off-site improvement activity noise levels are shown to approach 65.3 dBA L_{eq} and will exceed the City of Chino 65 dBA L_{eq} significance threshold during temporary Project construction activities at one of the 10 sensitive receiver locations, R9, adjacent to off-site improvements on Mayhew Avenue. Therefore, the unmitigated noise impact due to Project off-site improvement construction activities is considered *potentially significant* at receiver location R9. All other receiver locations will experience unmitigated *less than significant* noise impacts during off-site improvement activities.

TABLE 10-10: UNMITIGATED CONSTRUCTION ACTIVITY NOISE LEVEL COMPLIANCE

Receiver Location[1]	Unmitigated Construction Noise Levels (dBA L_{eq})				Threshold Exceeded?[6]		
	Highest Daytime Activity Noise Levels[2]	Nighttime Concrete Pour Activity Noise Levels	Off-Site Improvement Activity Noise Levels	Threshold[5]	Highest Daytime Activity	Nighttime Concrete Pour Activity	Off-Site Improvement Activity
R1	72.5	56.2	44.7	65	**Yes**	No	No
R2	45.8	37.4	37.2	65	No	No	No
R3	68.2	55.0	37.8	65	**Yes**	No	No
R4	77.2	59.0	51.9	65	**Yes**	No	No
R5	67.7	55.6	64.8	65	**Yes**	No	No
R6	49.0	39.4	41.3	65	No	No	No
R7	52.2	38.2	40.5	65	No	No	No
R8	53.7	44.8	55.8	65	No	No	No
R9	46.1	37.9	65.3	65	No	No	**Yes**
R10	46.5	38.0	57.7	65	No	No	No

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Estimated daytime construction noise levels during peak operating conditions, as shown on Table 10-7.
[3] Estimated nighttime concrete pour construction noise levels during peak operating conditions, as shown on Table 10-8.
[4] Estimated off-site improvement construction noise levels during peak operating conditions, as shown on Table 10-9.
[5] Construction noise standards as shown on Table 3-2.
[6] Do the estimated Project construction noise levels satisfy the construction noise level threshold?

Therefore, temporary construction noise mitigation measures are required to reduce these impacts at receiver locations R1, and R3 to R5 during the daytime hours, and at R9 during off-site improvements. This includes mitigation in the form of a 150-foot buffer zone for large construction equipment (e.g. dozers, graders, scrapers, etc.) from receiver locations R1 and R3 to R5, if built and occupied at the time of Project construction, and an 8-foot high temporary noise barrier for receiver locations R4 and R5 if built and occupied at the time of Project

construction. Further, the existing residential home represented by receiver location R9 adjacent to off-site improvements shall require either a temporary 8-foot high noise barrier or sound dampening mats for heavy equipment capable of a minimum 5 dBA L_{eq} noise reduction for heavy mobile equipment engine compartments (e.g., cement mixers, dozers), as shown on Exhibit 10-B. The construction noise analysis presents a conservative approach with the highest noise-level-producing equipment for each stage of Project construction operating at the closest point from primary construction activity to the nearby sensitive receiver locations. This scenario is unlikely to occur during typical construction activities and likely overstates the construction noise levels which will be experienced at each receiver location. With the construction noise mitigation measures identified in the Executive Summary, shown on Exhibit 10-B, the worst-case construction noise level increases at the nearby residential receivers would be reduced.

The noise attenuation provided through temporary noise barriers depends on many factors including cost, wind loading, the location of the receiver, and the ability to place barriers such that the line-of-sight of the receiver is blocked to the noise source, among others. This analysis assumes a temporary noise barrier constructed using frame-mounted materials such as vinyl acoustic curtains or quilted blankets attached to the construction site perimeter fence.

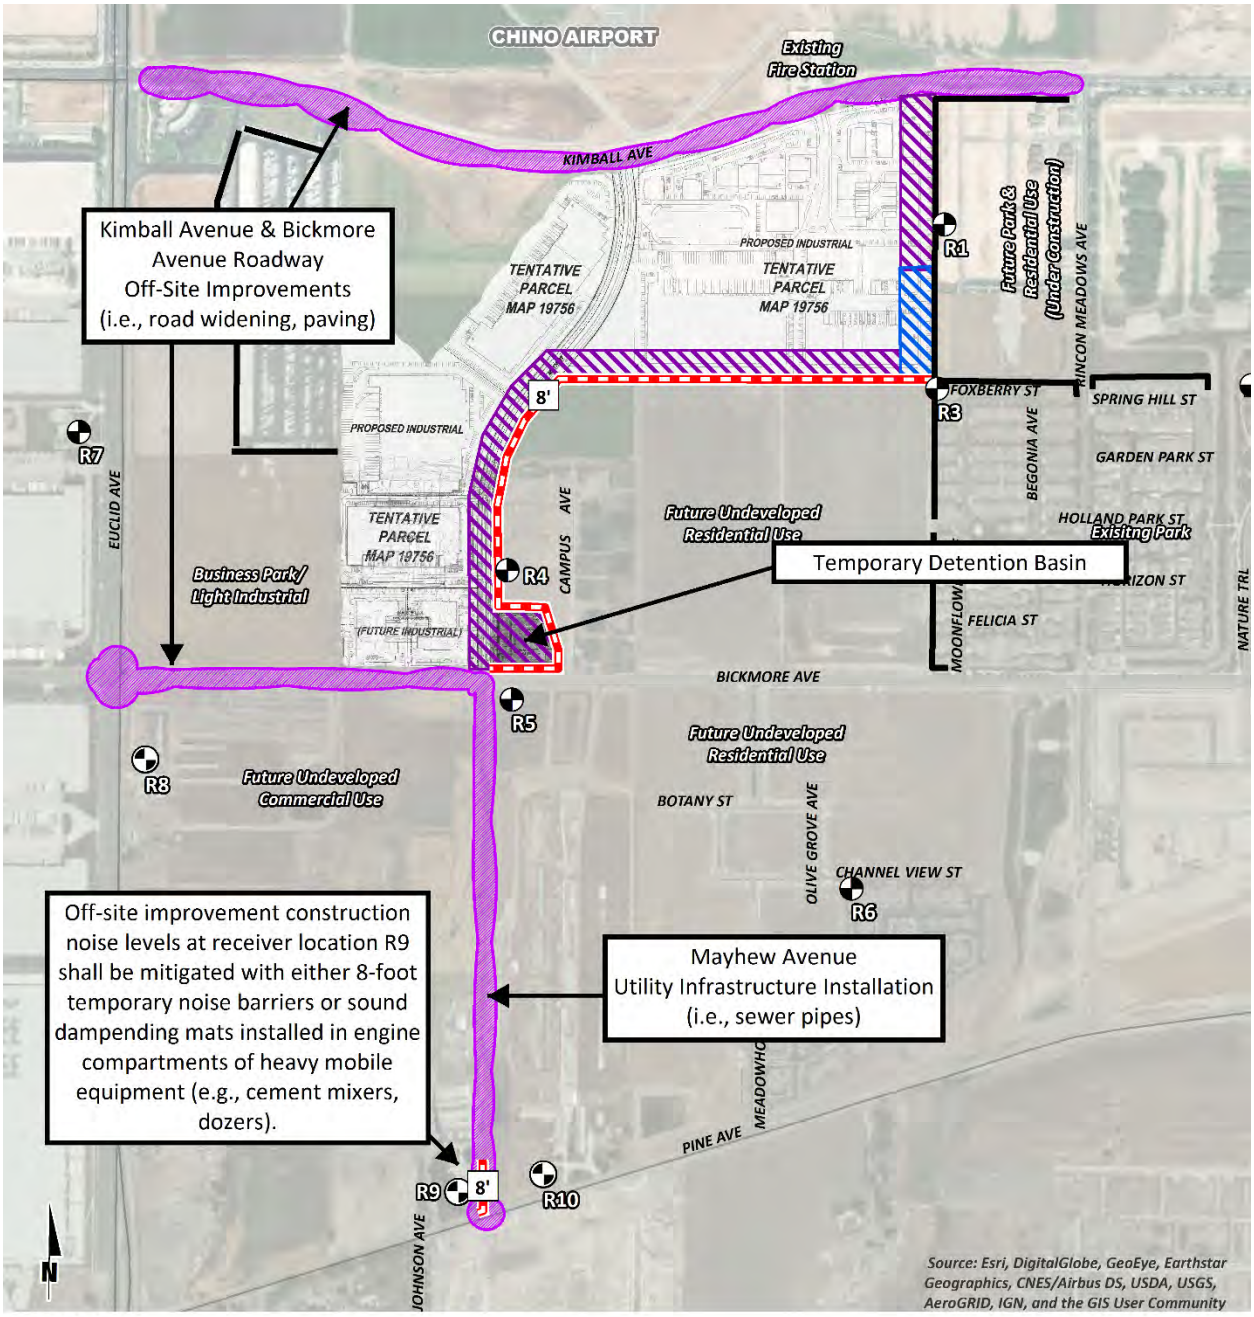
Table 10-11 shows the mitigated construction noise levels at the potentially impacted receiver locations will be reduced to range from 60.4 to 64.9 dBA L_{eq} with the attenuation provided by the 150-foot buffer zone for large construction equipment (e.g., dozers, graders, scrapers, etc.) with sound power level ratings greater than 100 dBA, and the 8-foot high temporary noise barrier. Therefore, since Project construction noise levels will be mitigated to below the 65 dBA L_{eq} City of Chino construction noise level threshold, the noise impact due to Project construction is considered a *less than significant* impact with mitigation. Sample temporary noise barrier photos are provided in Appendix 10.2 for reference.

TABLE 10-11: MITIGATED CONSTRUCTION ACTIVITY NOISE LEVEL COMPLIANCE

Receiver Location[1]	Construction Activity Exceeding Threshold	Construction Noise Levels (dBA L_{eq})[2]					
		Highest Unmitigated Activity[2]	150' Buffer Attenuation	Temporary Noise Barrier Attenuation	Mitigated Peak Activity	Threshold[3]	Threshold Exceeded?[4]
R1	Daytime	72.5	-7.7	0.0	64.8	65	No
R3	Daytime	68.2	-3.4	0.0	64.7	65	No
R4	Daytime	77.2	-7.1	-5.1	64.9	65	No
R5	Daytime	67.7	0.0	-5.1	62.6	65	No
R9	Off-Site Improvements	65.3	0.0	-4.9[5]	60.4	65	No

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Estimated construction noise levels during peak operating conditions, as shown on Table 10-10.
[3] Construction noise standards as shown on Table 3-2.
[4] Do the estimated Project construction noise levels satisfy the construction noise level threshold?
[5] Or a 5 dBA reduction with sound dampening mats for heavy mobile equipment engine compartments for receiver location R9.

EXHIBIT 10-B: CONSTRUCTION NOISE MITIGATION MEASURES



LEGEND:

- Receiver Locations
- Off-Site Improvement Receiver Locations
- Existing 6-Foot High
- Potential Off-Site Improvement Areas
- Adjacent to existing sensitive receiver locations, a 150-foot buffer for large construction equipment (e.g., dozers, graders, scrapers) with sound power level ratings greater than 100 dBA is required.
- 8-foot high temporary noise barriers required if adjacent residential use is built and
- If adjacent planned residential use is built and occupied, a 150-foot buffer for large construction equipment (e.g., dozers, graders, scrapers) with sound power level ratings greater than 100 dBA is required.

10.7 CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to building, the vibration is usually short-term and is not of sufficient magnitude to cause building damage. It is not expected that heavy equipment such as large bulldozers would operate close enough to any residences to cause a vibration impact.
- Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration. Construction activities that would have the potential to generate low levels of ground-borne vibration within the Project site include grading. Using the vibration source level of construction equipment provided on Table 6-15 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 10-12 presents the expected Project related vibration levels at the nearby receiver locations.

Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference velocity of 0.089 in/sec PPV at 25 feet. At distances ranging from 62 to 1,691 feet from Project construction activities, construction vibration velocity levels are expected to approach 0.023 in/sec PPV, as shown on Table 10-12. To assess the human perception of vibration levels in PPV the velocities are converted to RMS vibration levels based on the Caltrans *Transportation and Construction Vibration Guidance Manual* conversion factor of 0.71. Table 10-12 shows the highest construction vibration levels in RMS are expected to approach 0.016 in/sec RMS at the nearby receiver locations. Based on the City of Chino Municipal Code standard of 0.05 in/sec RMS, the proposed Project construction activities will satisfy the vibration standard of 0.05 in/sec RMS at all receiver locations during Project construction. Therefore, the Project-related vibration impacts will be *less than significant* during the construction activities at the Project site.

Further, the Project-related construction vibration levels do not represent levels capable of causing building damage to nearby residential homes. The FTA identifies construction vibration levels capable of building damage ranging from 0.12 to 0.5 in/sec PPV. (3) The peak Project-construction vibration levels shown on Table 10-12, approaching 0.023 in/sec PPV, will not exceed the FTA vibration levels for building damage at the residential homes near the Project site. Further, the impacts at the site of the closest sensitive receivers are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating adjacent to the Project site perimeter.

TABLE 10-12: PROJECT CONSTRUCTION VIBRATION LEVELS

Receiver Location[1]	Distance to Closest Const. Activity (Feet)	Receiver PPV Levels (in/sec)[2]					RMS Velocity Levels (in/sec)[3]	Threshold Exceeded?[4]
		Small Bulldozer	Jack-hammer	Loaded Trucks	Large Bulldozer	Peak Vibration

Chapter 9.40 - NOISE*

Sections:

9.40.010 - Definitions.

The following words, phrases and terms as used in this chapter shall have the meanings as indicated here:

"Agricultural property" means a parcel of real property which is undeveloped for any use other than agricultural purposes.

"Ambient noise level" means the all-encompassing noise level associated with a given environment, being a composite of sounds from all sources, excluding the alleged offensive noise, at the location and approximate time at which a comparison with the alleged offensive noise is to be made.

"A-weighted sound level" means the total sound level meter with a reference pressure of twenty micro-pascals using the A-weighted network (scale) at slow response. The unit of measurement shall be defined as dBA.

"Commercial property" means a parcel of real property which is developed and used as either in or part or in whole for commercial purposes.

"Cumulative period" means an additive period of time composed of individual time segments which may be continuous or interrupted.

"Decibel (dB)" means a unit which denotes the ratio between two quantities which are proportional to power: the number of decibels corresponding to the ratio of two amounts of power is ten times the logarithm to the base ten of this ratio.

"Director of community development" means the director of community development of the city of Chino or his/her duly authorized deputy.

"Dwelling unit" means a single unit providing complete independent living facilities for one or more persons including permanent provisions for living, sleeping, eating, cooking and sanitation.

"Emergency machinery, vehicle, work or alarm" means any machinery, vehicle, work or alarm used, employed, performed or operated in an effort to protect, provide or restore safety conditions in the community or for the citizenry, or work by private or public utilities when restoring utility service.

"Fixed noise source" means a stationary device which creates sounds while fixed or motionless including but not limited to residential, agricultural, industrial and commercial machinery and equipment, pumps, fans, compressors, air conditioners and refrigeration equipment.

"Grading" means any excavating of filling of earth material or any combination thereof conducted at a site to prepare said site for construction or other improvements thereon.

"Hertz (Hz)" means the unit which describes the frequency of a function periodic in time which is the reciprocal of the period.

"Health care institution" means any hospital, convalescent home or other similar facility excluding residential.

"Impulsive noise" means a noise of short duration usually less than one second and of high intensity, with an abrupt onset and rapid decay.

"Industrial property" means a parcel of real property which is developed and used either in part or in whole for manufacturing purposes.

"Intruding noise level" means the total sound level, in decibels, created, caused, maintained or originating from an alleged offensive source at a specified location while the alleged offensive source is in operation.

"Licensed" means the issuance of a formal license or permit by the appropriate jurisdictional authority, or where no permits or licenses are issued, the sanctioning of the activity by the jurisdiction as noted in public record.

"Major roadway" means any street, avenue, boulevard or highway used for motor vehicle traffic which is owned or controlled by a public government entity.

"Mobile noise source" means any noise source other than a fixed noise source.

"Person" means a person, firm, association, co-partnership, joint venture, corporation or any entity, public or private in nature.

"Residential property" means a parcel of real property which is developed and used either in part or in whole for residential purposes, other than transient uses such as hotels and motels, and residential care facilities.

"Simple tone noise" means a noise characterized by a predominant frequency or frequencies so that other frequencies cannot be readily distinguished. If measured, simple tone noise shall exist if the one-third octave band sound pressure levels in the band with the tone exceeds the arithmetic average of the sound pressure levels of the two continuous one-third octave bands as follows: 5 dB for frequencies of 500 Hertz (Hz) and above or; by 15 dB for frequencies less than equal to 125 Hz.

"Sound level meter" means an instrument meeting American National Standard Institute's Standard S1.4-1971 or most recent revision thereof for Type 2 sound level meters or an instrument and the associated recording and analyzing equipment which will provide equivalent data.

"Sound pressure level" of a sound, in decibels, means twenty times the logarithm to the base 10 of the ratio of the pressure of the sound to a reference pressure shall be explicitly stated.

"Vibration" means any movement of the earth, ground or other similar surface created by a temporal and spacial oscillation device or equipment located upon, affixed in conjunction with that surface.

(Ord. 95-10 § 1 (part), 1995.)

9.40.020 - Decibel measurement criteria.

Any decibel measurement made pursuant to the provisions of this chapter shall be based on a reference sound pressure of twenty micro-pascals as measured with a sound level meter using the A-weighted network (scale) at slow response.

(Ord. 95-10 § 1 (part), 1995.)

9.40.030 - Designated noise zones.

The properties hereinafter described are assigned to the following noise zones:

Noise Zone I: All single-, double- and multiple-family residential properties.

Noise Zone II: All commercial properties.

Noise Zone III: All manufacturing or industrial properties.

(Ord. 95-10 § 1 (part), 1995.)

9.40.040 - Exterior noise standards.

The following noise standards, unless otherwise specifically indicated, shall apply to all residential property with a designated noise zone:

These criteria are given in terms of allowable noise levels for a given period of time at the residential property boundary. Higher noise levels are permitted during the day (seven a.m. to ten p.m.) than the night (ten p.m. to seven a.m.). The table below shows the acceptable levels at residential land uses during the daytime and nighttime.

City of Chino Exterior Noise Ordinance

Criteria for Residential Properties (Zone 1)

Maximum Time of Exposure	Noise		
Metric	Noise Level Not to Exceed		
		7 am—10 pm	10 pm—7 am
30 min/hr	L50	55 dBA	50 dBA
15 min/hr	L25	60 dBA	55 dBA
5 min/hr	L8.3	65 dBA	60 dBA
1 min/hr	L1.7	70 dBA	65 dBA
Any period of time	Lmax	75 dBA	70 dBA

Each of the noise limits specified here shall be reduced by five dBA for impulse or simple tone noises, or for noises consisting of speech or music; provided, however, that if the ambient noise level exceeds the resulting standard, the ambient shall be the standard.

It is unlawful for any person at any location within the incorporated area of the city to create any noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level when measured on any other property, to exceed:

A. The noise standard for a cumulative period of more than thirty minutes in any hour; or
B. The noise standard plus five dBA for a cumulative period of more than fifteen minutes in any hour; or
C. The noise standard plus ten dBA for a cumulative period of more than five minutes in any hour; or
D. The noise standard plus fifteen dBA for a cumulative period of more than one minute in any hour; or
E. The noise standard plus twenty dBA for any period of time.

In the event the ambient noise level exceeds any of the first four noise limit categories above, the cumulative period applicable to said category shall be increased to reflect said ambient noise level. In the event the ambient noise level exceeds the fifth noise category, the maximum allowable noise level under said category shall be increased to reflect the maximum ambient noise level.

If the measurement location is on boundary between two different noise zones, the lower noise level standard applicable to the noise zone shall apply.

If the intruding noise source is continuous and cannot be reasonably discontinued or stopped for a time period whereby the ambient noise level can be determined, the measured noise level obtained while the source is in operation shall be compared directly to the allowable noise level standards as specified respective to the measurement location's designated land use and for the time of the day the noise level is measured.

A. The reasonableness of temporarily discontinuing the noise generation by an intruding noise source shall be determined by the director or his/her duly authorized deputy for the purpose of establishing the existing ambient noise level at the measurement location.

(Ord. 95-10 § 1 (part), 1995.)

9.40.050 - Interior noise standards.

The following noise standard, unless otherwise specifically indicated, shall apply to all residential property within all noise zones:

Each of the noise limits specified above shall be reduced by five dBA for impulse or simple tone noises or for noises consisting of speech or music provided, however, if the ambient noise level exceeds the resulting standard, the ambient shall be the standard.

It is unlawful for any person at any location within the incorporated area of the city to create any noise or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such a person which causes the noise level when measured within any other residential dwelling unit in any noise zone to exceed:

A. The noise standard for cumulative period of more than five minutes in any hour; or

B. The noise standard plus 5 dBA for a cumulative period of more than one minute in any hour; or

C. The noise standard plus ten dBA for any period of time.

In the event the ambient noise level exceeds any of the first two noise limit categories above, the noise standard applicable to said category shall be increased to reflect the maximum ambient noise level.

If the measurement location is on a boundary between two different noise zones, the lower noise level standard applicable to the noise zone shall apply.

If the intruding noise source is continuous and cannot reasonably be discontinued or stopped for a time period whereby the ambient noise level can be determined; the same procedures specified in Section 9.40.040(E), shall be deemed proper to enforce the provisions of this section.

(Ord. 95-10 § 1 (part), 1995.)

9.40.060 - Special provisions.

The following activities shall be exempted from the provisions of this chapter:

A. Activities conducted on public parks, public playgrounds and public or private school grounds including school athletic and school entertainment events that are conducted under the sanction of the school or which a license or permit has been duly issued pursuant to any provision of the city code;

B. Occasional outdoor gatherings, public dances, show, sporting and entertainment events, provided said events are conducted pursuant to a permit or license issued by the appropriate jurisdiction relative to the staging of said events. Such permits and licenses may restrict noise;

C. Any mechanical device, apparatus or equipment used, related to or connected with emergency machinery, vehicle, work or warning alarm or bell, provided the sounding of any bell or alarm on any building or motor vehicle shall terminate its operation within thirty minutes in any hour of its being activated;

D. Noise sources associated with or vibration created by construction, repair, remodeling or grading of any real property or during authorized seismic surveys, provided said activities do not take place outside the hours for construction as defined in Section 15.44.030 of this code, and provided the noise standard of sixty-five dBA plus the limits specified in Section 9.40.040(B) as measured on residential property and any vibration created does not endanger the public health, welfare and safety;

E. All mechanical devices, apparatus or equipment associated with agriculture operations provided:

1. Operations do not take place between eight p.m. and seven a.m. on weekdays, including Saturday, or at any time Sunday or a Federal holiday, or

2. Such operations and equipment are utilized for the protection of salvage of agricultural crops during periods of potential or actual frost damage or other adverse weather conditions, or

3. Such operations and equipment are associated with agricultural pest control through pesticide application, provided the application is made in accordance with permits issued by or regulations enforced by the California Department of Agriculture,

4. Noise sources associated with the maintenance of real property, provided said activities take place between the hours of seven a.m. to eight p.m. on any day except Sunday, or between the hours of nine a.m. and eight p.m. on Sunday,

5. Any activity to the extent regulation thereof has been preempted by state or federal law.

NOTE: Preemption may include motor vehicle, aircraft in flight, and railroad noise regulations.

(Ord. 2004-23 § 59, 2004; Ord. 95-10 § 1 (part), 1995.)

9.40.070 - Schools, churches, libraries, health care institutions—Special provisions.

It shall be deemed unlawful for any person to create any noise which causes the noise level at any school, hospital or similar health care institution, church or library while the same is in use, to exceed the noise standards specified in Section 9.40.040 prescribed for the assigned noise zone level, unreasonably interferes with the use of such institutions, or which unreasonably disturbs or annoys patients in a hospital, convalescent home or other similar health care institutions, provided conspicuous signs are displayed in three separate locations within one-tenth-mile of the institution or facility indicating a quiet zone.

(Ord. 95-10 § 1 (part), 1995.)

9.40.080 - Air conditioning and refrigeration—Special provisions.

Until January 1, 1996, the noise standards enumerated in Section 9.40.040 and 9.40.050 shall be increased five dBA where the alleged intruding noise source is an air conditioning or refrigeration system or associated equipment which was installed prior to the effective date of the ordinance codified in this chapter.

(Ord. 95-10 § 1 (part), 1995.)

9.40.090 - Noise sources generated on publicly owned property.

Notwithstanding any other provision of this code and in addition thereto, it is unlawful for any person to permit or cause any noise, sound, music or program to be emitted from any radio, tape player, tape recorder, record player, television outdoors, or any other mode on or in any publicly owned property, park or place when such noise, sound, music or program is audible to a person of normal hearing sensitivity one hundred feet from said radio, tape player, tape recorder, record player or television.

A. As used herein, "a person of normal hearing sensitivity" means a person who has a hearing threshold level of between zero decibels and twenty-five decibels HL averaged over the frequencies 500, 1,000 and 2,000 Hertz.

B. Notwithstanding any other provision of this code, any person violating this section shall be guilty of an infraction and upon conviction thereof, is punishable by a fine not exceeding fifty dollars, for a first violation; a fine not exceeding one hundred dollars for a second violation of this section within one year; a fine not exceeding two hundred fifty dollars for each additional violation of this section within one year. A person who violates the provisions of this section shall be deemed to be guilty of a separate offense for each day, or portion thereof, during which the violation continues or is repeated.

C. Notwithstanding any other provision of this code, no citation or notice to appear shall be issued or criminal complaint shall be filed for a violation of this section unless the offending party is first given a verbal or written notification of violation by any peace officer, public officer, park ranger or other person charged with enforcing this section and the offending party given an opportunity to correct said violation.

D. This section shall not apply to broadcasting from any aircraft, vehicle or stationary sound amplifying equipment or to the use of radios, tape players, tape recorders, record players or televisions in the course of an assembly or festival for which a license has been issued or a parade for which a permit has been issued pursuant to or any other activity, assembly or function for which a permit or license has been duly issued pursuant to any provision of the city code.

(Ord. 95-10 § 1 (part), 1995.)

9.40.100 - Noise level measurement.

The location selected for measuring exterior noise levels shall be made within the affected residential unit. The measurements shall be made at a point at least four feet from the wall, ceiling or floor nearest the noise source with windows in an open position depending on the normal seasonal ventilation requirements.

(Ord. 95-10 § 1 (part), 1995.)

9.40.110 - Vibration.

Notwithstanding other sections of this chapter, it is unlawful for any person to create, maintain or cause any ground vibration which is perceptible without instruments at any point on any affected property adjoining the property on which the vibration source is located. For the purpose of this chapter, the perception threshold shall be presumed to be more than 0.05 inches per second RMS vertical velocity.

(Ord. 95-10 § 1 (part), 1995.)

9.40.120 - Proposed developments.

Each department whose duty it is to review and approve new projects or changes to existing projects that result or may result in the creation of noise shall consult with the director prior to any such approval. If at any time the director of community development has reason to believe that a standard, regulation, action, proposed standard, regulation or action of any department respecting noise does not conform to the provisions as specified in this chapter, the director may request such department to consult with them on the advisability of revising such standard or regulation to obtain uniformity.

(Ord. 95-10 § 1 (part), 1995.)

9.40.130 - Variance procedure.

The variance procedure process shall remain as specified in the city's zoning code (Title 20).

(Ord. 95-10 § 1 (part), 1995.)

9.40.140 - Planning commission.

The planning commission shall evaluate all applications for variance from the requirements of this chapter and may grant said variances with respect to time for compliance, subject to such terms, conditions and requirements as it may deem reasonable to achieve maximum compliance with the provisions of this chapter. Said terms, conditions and requirements may include, but shall not be limited to, limitation on noise levels and operating hours. Each such variance shall set forth in detail the approved method of achieving maximum compliance and a time schedule for its accomplishment. In its determinations, the commission shall consider the following:

A. The magnitude of nuisance caused by the offensive noise;

B. The uses of property within the area of impingement by the noise;

C. The time factors related to study, design, financing and construction of remedial work;

D. The economic factors related to age and useful life of the equipment;

E. The general public interest, welfare and safety.

Any variance granted by the commission shall be by resolution and shall be transmitted to the director of community development for enforcement. Any violation of the terms of said variance shall be unlawful.

The planning commission may require additional acoustical studies based on the individual circumstances of each case. Such studies must be performed by a person qualified in acoustical engineering with the state of California.

Meetings of the planning commission shall be held at the call of the secretary and at such times and locations as the commission shall determine. All such meetings shall be open to the public.

(Ord. 95-10 § 1 (part), 1995.)

9.40.150 - Appeals.

The appeal procedure process shall remain as specified in the city's zoning code (Title 20).

(Ord. 95-10 § 1 (part), 1995.)

9.40.160 - Prima facie violation.

Any noise exceeding the noise level standard as specified in Section 9.40.040 and 9.40.050 or vibration exceeding the standard as specified in Section 9.40.110 of this chapter, shall be deemed to be prima facie evidence of a violation of the provisions of this chapter.

(Ord. 95-10 § 1 (part), 1995.)

9.40.170 - Violations/misdemeanors.

Any persons violating any of the provisions of this chapter shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined in an amount not to exceed an amount as specified by city council resolution, or be imprisoned in the Jail for a period not to exceed six months or by both such fine and imprisonment. Each day such violation is committed or permitted to continue shall constitute a separate offense and shall be punishable as such.

(Ord. 95-10 § 1 (part), 1995.)

9.40.180 - Violations/additional remedies— Injunctions.

As an additional remedy, the operation or maintenance of any device, instrument, vehicle or machinery in violation of any provisions of this chapter which operation or maintenance causes or creates sound levels or vibration exceeding the allowable standards as specified in this chapter shall be deemed and is hereby declared to be a public nuisance and may be subject to abatement summarily by a restraining order or injunction issued by a court of competent jurisdiction.

Any violation of this chapter is declared to be a public nuisance and may be abated in accordance with law. The expense of this chapter is declared to be public nuisance and may be by resolution of the city council declared to be a lien against the property on which such nuisance is maintained, and such lien shall be made a personal obligation of the property owner.

(Ord. 95-10 § 1 (part), 1995.)

9.40.190 - Manner of enforcement.

The director is directed to enforce the provisions of this chapter and is authorized and may cite at his/her discretion, any person without a warrant who has reasonable cause to believe that such person has committed a misdemeanor in his/her presence.

No person shall interfere with, oppose or resist any authorized person charged with the enforcement of this chapter while such person is engaged in the performance of his/her duty.

Violations of this chapter shall be prosecuted in the same manner as other misdemeanor violations pursuant to Chapter 1.12; provided, however, that in the event of an initial violation of the provisions of this chapter, a written notice shall be given the alleged violator which specifies the time by which the condition shall be corrected or an application for variance shall be received by the event the cause of the violation has been removed, the condition abated or fully corrected within the time period specified in the written notice.

In the event the alleged violated cannot be located in order to serve the notice of intention to prosecute, the notice as required herein shall be deemed to be given upon mailing such notice to registered or certified mail to the alleged violator at his last known address or at the place where the violation occurred in which event the specified time period for abating the violation or applying for a variance shall commence at the date of the day following the mailing of such notice. Subsequent violations of the same offense shall result in the immediate filing of a misdemeanor complaint.

(Ord. 95-10 § 1 (part), 1995.)

9.40.200 - Delay in implementation—Fixed noise sources.

None of the provisions of this chapter shall apply to a fixed sound source during the period commencing the effective date of this chapter and terminating one-hundred eighty days thereafter.

(Ord. 95-10 § 1 (part), 1995.)

OFF-SITE TRAFFIC NOISE CONTOURS

This page intentionally left blank

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing Without Project
Road Name: Central Av.
Road Segment: n/o Chino Hills Pkwy.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	28,614 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	2,861 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	76 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	60.0 feet
Centerline Dist. to Observer:	60.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing Without Project | Project Name: Altitude
Road Name: Edison Av. | Job Number: 9776
Road Segment: w/o Euclid Av.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	17,363 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	1,736 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	76 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	60.0 feet
Centerline Dist. to Observer:	60.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing With Phase 1 | Project Name: Altitude
Road Name: Euclid Av. | Job Number: 9776
Road Segment: s/o Pine Av.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	34,676	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	3,468	vehicles
Vehicle Speed:	55	mph
Near/Far Lane Distance:	154	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	84.0	feet
Centerline Dist. to Observer:	84.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.16%
Medium Trucks:	81.2%	5.4%	13.4%	4.99%
Heavy Trucks:	82.1%	2.8%	15.1%	3.85%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.941
Medium Trucks:	33.679
Heavy Trucks:	33.705

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing With Project Buildout
Road Name: Kimball Av.
Road Segment: e/o Mountain Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	18,839 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	1,884 vehicles
Vehicle Speed:	50 mph
Near/Far Lane Distance:	36 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	44.0 feet
Centerline Dist. to Observer:	44.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	90.18%
Medium Trucks:	81.2%	5.4%	13.4%	5.08%
Heavy Trucks:	82.1%	2.8%	15.1%	4.74%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	40.460
Medium Trucks:	40.241
Heavy Trucks:	40.262

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC 2018 With Phase 1 | Project Name: Altitude
Road Name: Chino Hills Pkwy. | Job Number: 9776
Road Segment: w/o SR-71

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	44,640	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	4,464	vehicles
Vehicle Speed:	40	mph
Near/Far Lane Distance:	51	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	49.0	feet
Centerline Dist. to Observer:	49.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.31%
Medium Trucks:	81.2%	5.4%	13.4%	5.00%
Heavy Trucks:	82.1%	2.8%	15.1%	3.70%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC 2019 Without Project
Road Name: Hellman Av.
Road Segment: s/o Kimball Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	13,074 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	1,307 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	51 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	49.0 feet
Centerline Dist. to Observer:	49.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC 2019 With Phase 1+2 | Project Name: Altitude
Road Name: Chino Hills Pkwy. | Job Number: 9776
Road Segment: e/o Ramona Av.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	29,890 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	2,989 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	51 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	49.0 feet
Centerline Dist. to Observer:	49.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.13%
Medium Trucks:	81.2%	5.4%	13.4%	5.01%
Heavy Trucks:	82.1%	2.8%	15.1%	3.86%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	42.140
Medium Trucks:	41.929
Heavy Trucks:	41.950

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC 2020 Without Project
Road Name: Kimball Av.
Road Segment: e/o San Antonio Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	25,880	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	2,588	vehicles
Vehicle Speed:	50	mph
Near/Far Lane Distance:	36	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	44.0	feet
Centerline Dist. to Observer:	44.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.30%
Medium Trucks:	81.2%	5.4%	13.4%	5.00%
Heavy Trucks:	82.1%	2.8%	15.1%	3.70%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	40.460
Medium Trucks:	40.241
Heavy Trucks:	40.262

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC 2020 With Proj Buildout
Road Name: El Prado Rd.
Road Segment: e/o Central Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	35,687	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	3,569	vehicles
Vehicle Speed:	45	mph
Near/Far Lane Distance:	36	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	44.0	feet
Centerline Dist. to Observer:	44.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	90.71%
Medium Trucks:	81.2%	5.4%	13.4%	5.04%
Heavy Trucks:	82.1%	2.8%	15.1%	4.25%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	40.460
Medium Trucks:	40.241
Heavy Trucks:	40.262

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: HY 2040 w/o Proj w/o Limonite
Road Name: Kimball Av.
Road Segment: e/o Euclid Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	21,690 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	2,169 vehicles
Vehicle Speed:	50 mph
Near/Far Lane Distance:	51 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	49.0 feet
Centerline Dist. to Observer:	49.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.30%
Medium Trucks:	81.2%	5.4%	13.4%	5.00%
Heavy Trucks:	82.1%	2.8%	15.1%	3.70%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	42.140
Medium Trucks:	41.929
Heavy Trucks:	41.950

FHWA Noise Model Calculations

VehicleType	REMEL	Traffic Flow	Distance	Finite Road	Fresnel	Barrier Atten	Berm Atten
Autos:	70.20	0.67	1.01	-1.20	-4.64	0.000	0.000
Medium Trucks:	81.00	-11.94	1.04	-1.20	-4.87	0.000	0.000
Heavy Trucks:	85.38	-13.25	1.04	-1.20	-5.44	0.000	0.000

Unmitigated Noise Levels (without Topo and barrier attenuation)

VehicleType	Leq Peak Hour	Leq Day	Leq Evening	Leq Night	Ldn	CNEL
Autos:	70.7	68.6	66.9	62.4	70.3	70.8
Medium Trucks:	68.9	67.2	61.4	60.6	68.5	68.8
Heavy Trucks:	72.0	70.3	61.6	64.2	71.9	72.0

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: HY 2040 w/ Proj w/o Limonite
Road Name: Kimball Av.
Road Segment: e/o Mountain Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	20,756 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	2,076 vehicles
Vehicle Speed:	50 mph
Near/Far Lane Distance:	36 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	44.0 feet
Centerline Dist. to Observer:	44.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	90.28%
Medium Trucks:	81.2%	5.4%	13.4%	5.07%
Heavy Trucks:	82.1%	2.8%	15.1%	4.64%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	40.460
Medium Trucks:	40.241
Heavy Trucks:	40.262

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: HY 2040 w/o Proj w/ Limonite
Road Name: Chino Hills Pkwy.
Road Segment: e/o Monte Vista Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	23,323	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	2,332	vehicles
Vehicle Speed:	45	mph
Near/Far Lane Distance:	76	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	60.0	feet
Centerline Dist. to Observer:	60.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.30%
Medium Trucks:	81.2%	5.4%	13.4%	5.00%
Heavy Trucks:	82.1%	2.8%	15.1%	3.70%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	46.701

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: HY 2040 w/o Proj w/ Limonite
Road Name: Kimball Av.
Road Segment: e/o Rincon Meadows Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	27,062 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	2,706 vehicles
Vehicle Speed:	50 mph
Near/Far Lane Distance:	51 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	49.0 feet
Centerline Dist. to Observer:	49.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	91.30%
Medium Trucks:	81.2%	5.4%	13.4%	5.00%
Heavy Trucks:	82.1%	2.8%	15.1%	3.70%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	42.140
Medium Trucks:	41.929
Heavy Trucks:	41.950

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: HY 2040 w/ Proj w/ Limonite
Road Name: Kimball Av.
Road Segment: w/o Rincon Meadows Av.
Project Name: Altitude
Job Number: 9776

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	23,696	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	2,370	vehicles
Vehicle Speed:	50	mph
Near/Far Lane Distance:	51	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	49.0	feet
Centerline Dist. to Observer:	49.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	74.1%	12.6%	13.3%	90.88%
Medium Trucks:	81.2%	5.4%	13.4%	4.97%
Heavy Trucks:	82.1%	2.8%	15.1%	4.15%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	42.140
Medium Trucks:	41.929
Heavy Trucks:	41.950
