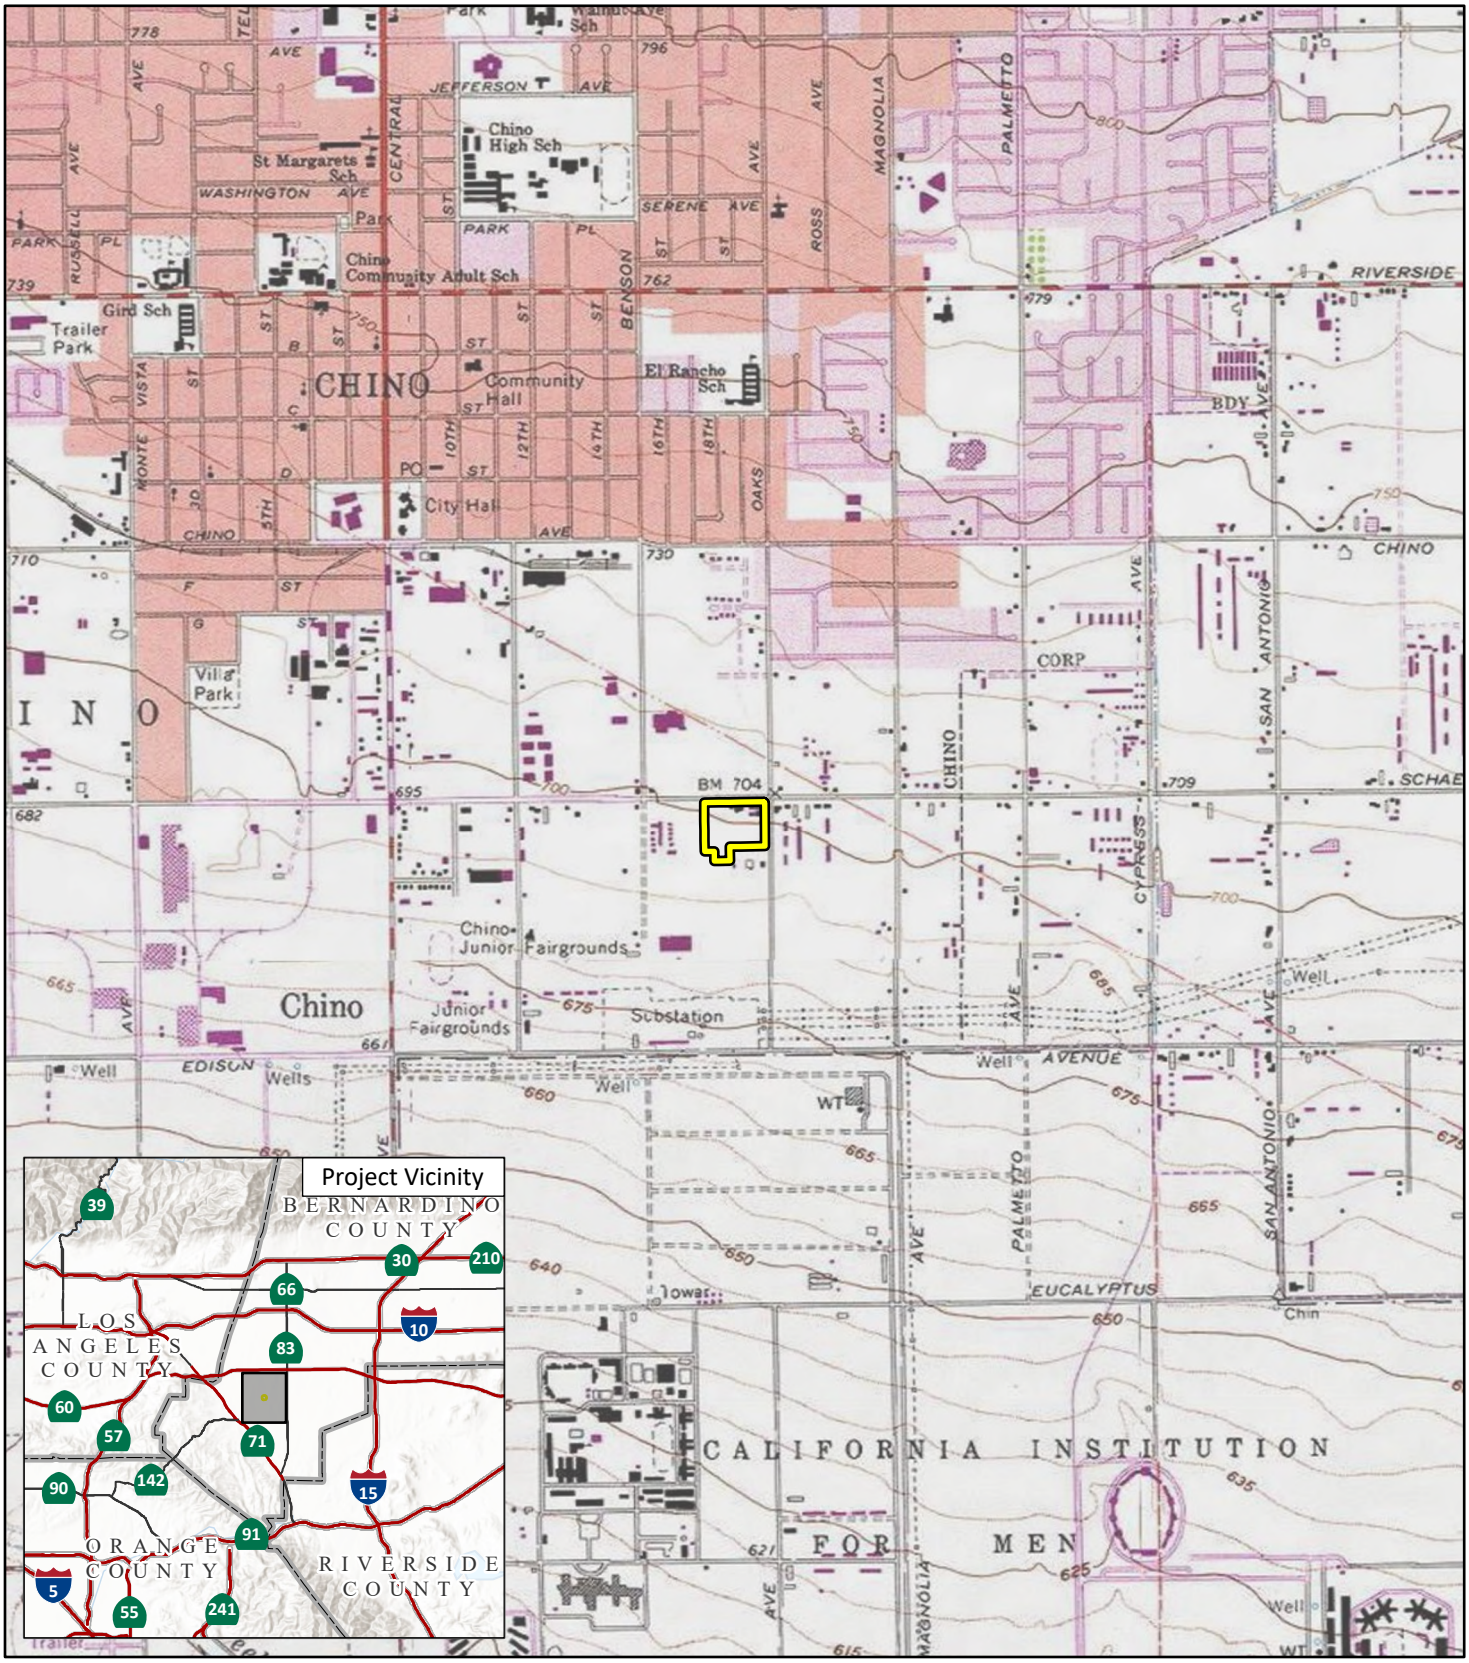
INTRODUCTION

LSA prepared this construction and operational health risk assessment (HRA) for the proposed Chino Gateway Terminal Project (project) in Chino, California.



An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. This HRA's purpose is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.

The City of Chino recommends the preparation of an HRA in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). This HRA evaluates all these criteria in compliance with applicable requirements.

PROJECT LOCATION AND DESCRIPTION

The 7.35-acre project site is southwest of the Schaefer Avenue and Oaks Avenue intersection in Chino, in western San Bernardino County, California (Assessor's Parcel Numbers 1021-052-04; 1021-052-06; 1021-052-09; and 1021-052-11). The project site is bounded by Schaefer Avenue and residential uses to the north, Oaks Avenue and commercial uses to the east, commercial and industrial uses to the south, and commercial and industrial uses to the west. Access to the project site is provided via three existing driveways along Oaks Avenue and five existing driveways along Schaefer Avenue. Figure 1, Project Location, and Figure 2, Site Plan, depict the location of the project site on a regional and local scale.

The project includes total demolition of three existing buildings and associated ancillary structures located on the project site, totaling 17,716 square feet. The project includes one 158,548 square-foot tilt-up warehouse building (150,048 square feet of warehouse space, 3,500 square feet of office space and 5,000 square feet of mezzanine). The project also includes a separate 3,520 square-foot detached multi-tenant restaurant/office building at the northeast corner of the project site that would facilitate four restaurants and 3,600 square feet of outdoor seating. The project would include a total of 33,733 square feet of landscaping throughout the project site. The project also includes development of 128 passenger vehicle parking spaces, 10 truck parking spaces, 20 loading docks and 1 ground-level roll-up door.

Chino Gateway Terminal Project

Proposed Conceptual Site Plan

Although the proposed industrial and commercial uses are speculative, the warehouse building would not include cold storage during operation.

The proposed project is anticipated to generate up to 72 employees, with approximately 18 employees generated by the restaurant uses and 54 employees generated by the warehousing uses. The hours of operation for the proposed facilities include 8:00 a.m. to 10:00 p.m. 7 days per week for the restaurant tenants; 24 hours per day and 7 days per week for the industrial tenant; and 7:00 a.m. to 7:00 p.m. Monday through Friday for the office tenants. Once operational, the proposed warehouse building would generate 187 passenger car trips, 18 two-axle truck trips, 15 three-axle truck trips, and 51 four-axle truck trips; the fast-food restaurant would generate 195 trips.[1]

Construction of the proposed project is anticipated to take place over a period of 14 months, beginning October of 2025 and ending in 2026. Construction activities include demolition of three existing buildings and associated ancillary structures (totaling 17,716 square feet). This analysis assumes that the proposed project would comply with SCAQMD Rule 403 measures. Construction equipment would utilize Tier 2 with Level 3 diesel particulate filters (DPF). Construction equipment anticipated to be used includes bulldozers, loaders/backhoes, scrapers, cranes, forklifts, rollers, concrete pumps, and paving equipment. In addition, the proposed project would result in 112 cubic yards of soil exportation.

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors contain segments of the population most vulnerable to the effects of air pollution. The areas adjacent to the project site include the following uses:

- **North:** Schaefer Avenue and existing residential uses
- **East:** Oaks Avenue and existing industrial uses
- **South:** Existing commercial and industrial uses
- **West:** Existing commercial and industrial uses

The nearest sensitive receptors are:

- **North:** single-family residences across Schaefer Avenue approximately 90 feet north of the northern edge of the project site

BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the SCAQMD.

CALIFORNIA AIR RESOURCES BOARD HANDBOOK AND TECHNICAL ADVISORY

CARB has developed an *Air Quality and Land Use Handbook* (CARB Handbook)[2] and a supplement, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*[3], which are intended to serve as general reference guides for evaluating and reducing air pollution impacts associated with new projects that are part of the land use decision-making process. According to the CARB Handbook, recent air pollution studies have shown an association between both respiratory and other noncancer health effects and proximity to high-traffic roadways and other land uses associated with high volume truck traffic. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that planning agencies recognize that the configuration of warehouse and distribution centers can reduce population exposure and risk. For example, locating the main entry and exit points away from sensitive land uses helps to reduce cancer risks and other health impacts.

Land uses that can produce air pollution sources of concern include freeways, rail yards, ports, refineries, distribution centers, chrome plating facilities, dry cleaners, and large gasoline service stations. Key recommendations in the CARB Handbook include taking steps to avoid siting new, sensitive land uses:

- Within 500 feet of a freeway, urban roads with 100,000 vehicles/day or rural roads with 50,000 vehicles/day;
- Within 1,000 feet of a major service and maintenance rail yard;
- Immediately downwind of ports (in the most heavily impacted zones) and petroleum refineries;
- Within 300 feet of any dry cleaning operation (for operations with two or more machines, provide 500 feet); and
- Within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater).

2 California Air Resources Board (CARB). 2005. *Air Quality and Land Use Handbook: A Community Health Perspective*. April. Website: https://www.aqmd.gov/docs/default-source/ceqa/handbook/california-air-resources-board-air-quality-and-land-use-handbook-a-community-health-perspective.pdf (accessed April 2025).

3 CARB. 2017. *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*. April. Website: www.arb.ca.gov/ch/rd_technical_analysis_fact_sheet.pdf (accessed April 2025).

The CARB Handbook specifically states that its recommendations are advisory and acknowledges land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.

The recommendations are generalized and do not consider site-specific meteorology, freeway truck percentages, or other factors that influence risk for a particular project site. The purpose of this guidance is to help land use agencies determine when to further examine project sites for actual health risk associated with the location of new sensitive land uses.

OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[4] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[5] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by the California Environmental Quality Act (CEQA). The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA, guidelines to engage the public, presentation guidelines for results from the HRA, and mitigation measures that may be appropriate for various land use projects.

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The SCAQMD has risk assessment guidelines, *AB 2588 and Rule 1402 Supplemental Guidelines*[6]. These guidelines incorporate the OEHHA guidance and the options to be used when using the CARB's Hotspots Analysis and Reporting Program Version 2 (HARP) program for risk assessment calculations.[7]

SETTING

REGIONAL AIR QUALITY

The project site is in Chino, California, which is part of the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD.

Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the Chino Airport Station. Figure 3, Project Area Wind Patterns, shows the windrose[8] from data measured at this station and the wind patterns for the project area.

Source: SCAQMD Meteorological Data for AERMOD. Website: www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod (accessed January 2025).

Figure 3: Project Area Wind Patterns

Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in the State of California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in

[8] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or that may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated air quality management district or air pollution control district. High-priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter or DPM).

THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million (1×10^{-5}) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD *CEQA Air Quality Handbook*[9] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*[10], for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed project.

9 SCAQMD. 1993. *CEQA Air Quality Handbook* (currently under revision).

10 SCAQMD. 2003. *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*. August.

METHODOLOGY

The following describes the methodology used to estimate health risk impacts.

CONSTRUCTION HEALTH RISK ASSESSMENT

General Information

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency's (EPA) AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emission strength, distance from the source to the receptor, and meteorological data.

Emission Sources

The California Emissions Estimator Model version 2022.1 (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site, which were included in AERMOD. This analysis assumes that construction of the proposed project is anticipated to take place over a period of 14 months, beginning October of 2025 and ending in 2026, which was included in CalEEMod. Construction activities include demolition of three existing buildings and associated ancillary structures (totaling 17,716 square feet), which was included in CalEEMod. Construction equipment anticipated to be used includes bulldozers, loaders/backhoes, scrapers, cranes, forklifts, rollers, concrete pumps, and paving equipment. In addition, the proposed project would result in 112 cubic yards of soil exportation, which was also included in CalEEMod. This analysis also assumes the use of Tier 2 with Level 3 DPF construction equipment and that the proposed project would comply with SCAQMD dust control regulations. All other construction details are not yet known; therefore, default assumptions (e.g., construction worker and truck trips and fleet activities) from CalEEMod were used.

OPERATIONAL HEALTH RISK ASSESSMENT

General Information

To determine the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed project.

For the purposes of an HRA, emissions are analyzed for acute health impacts, chronic, and carcinogenic health impacts. A multipathway assessment has been conducted to evaluate the project's emissions during construction and operation following the modeling techniques

recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[11] The analysis herein has been conducted in accordance with SCAQMD requirements for HRAs.

This HRA has been conducted using three models: (1) the CARB's California Emissions Factor Model, Version 2021 (EMFAC2021) for vehicle emissions factors and percentages of fuel type within the overall vehicle fleet; (2) the EPA AERMOD dispersion model to determine how the TACs would move through the atmosphere after release from sources both on site and along the truck routes; and (3) the CARB's HARP model to translate the pollutant concentrations from AERMOD into individual health risks at the nearby sensitive receptor locations.

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles (also known as DPM) made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to DPM also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. The HRA analyses used particulate matter less than 10 microns in diameter (PM_{10}) emissions to represent DPM emissions, consistent with OEHHA guidance.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per microgram per cubic meter is based on the upper 95th percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk DPM poses.

- The risk estimates assume sensitive residence receptors would be subject to DPM for 24 hours per day, 350 days per year and worker receptors for 8 hours per day, 350 days per year. As a conservative measure, SCAQMD does not recognize indoor adjustments for residents or workers. However, people typically spend the majority of their time indoors versus remaining outdoors for 24 hours per day, 350 days per year.[12] Therefore, the actual exposure any person would experience would be less than considered in this analysis. This results in much lower actual health risk levels than presented in this analysis.

---

11 California Office of Environmental Health Hazard Assessment (OEHHA). 2015. *Air Toxics Hot Spots Program Guidance Manual*. March. Website: oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0 (accessed April 2025).

12 In May 1991, the CARB Research Division, in association with the University of California, Berkeley, published research findings titled *Activity Patterns of California Residents*. The findings of that study indicate that, on average, adults and adolescents in California spent almost 15 hours per day inside their homes and 6 hours in other indoor locations, for a total of 21 hours (87 percent of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years for the residential receptors and 25 years for the worker receptors). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancements to reduce DPM. Therefore, the health risk levels from these future trucks would be less than presented in this analysis.

Improvements over the last 40 years to diesel fuel and diesel engines have resulted in lower emissions of some of these TACs.[13] These improvements resulted in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment in 2010 and an 85 percent reduction in 2020 compared to 2000 levels.[14] These improvements are anticipated to continue into the foreseeable future. Electric trucks are also being phased in and, once in use, would eliminate the emissions of DPM associated with truck travel.

Emission Sources

The first step of an HRA is to characterize the project-related emissions of TACs. Based on the project's Traffic Impact Analysis, the proposed warehouse building would generate 187 passenger car trips, 18 two-axle truck trips, 15 three-axle truck trips, and 51 four-axle truck trips and the fast food restaurant would generate 195 trips.[15] It is assumed that the truck trips would travel approximately 40 miles per trip. The trucks would access the site via Schaefer Avenue. The proposed project would provide 20 dock doors; as the project would contain multiple loading docks, off-site queuing of trucks is not anticipated. Although the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes all the traffic information described and both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (PM_{10}) portion of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

Project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the two on-site driveways, along Schaefer Avenue going east and west, and along Oaks Avenue going north and south. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 miles per hour (mph), and that vehicles traveling on roadways would average 5–55 mph. This analysis also assumes that on-site truck idling would take place for approximately 15 minutes.

---

13 United States Environmental Protection Agency (EPA). n.d. *Learn About Impacts of Diesel Exhaust and the Diesel Emissions Reduction Act (DERA)*. Website: www.epa.gov/dera/learn-about-impacts-diesel-exhaust-and-diesel-emissions-reduction-act-dera (accessed April 2025).

14 OEHHA. 2001. *Health Effects of Diesel Exhaust*. May 21, 2001. Website: oehha.ca.gov/air/health-effects-diesel-exhaust (accessed April 2025).

15 LSA. 2025. Traffic Impact Analysis for the Chino Gateway Terminal Project (LSA Project No. 20241860). April.

EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of PM_{10}. Although the TAC of concern from diesel trucks is DPM, EMFAC2021 does not include emission factors for this TAC. DPM is a component of the overall exhaust from the project-related trucks. This HRA conservatively assumes the DPM emissions to be equal to the PM_{10} emissions when actually the DPM is only a portion of the overall PM_{10} in the truck exhaust. Although it is expected that the truck emissions rate will continue to reduce over time, an HRA only allows for a single emission rate to represent the entire 25- or 30-year exposure period. The use of emissions factors for the earliest year the proposed project could start operations (2026) was selected for this HRA to be conservative. For instance, based on operations starting in 2026, using emission factors for a 2030 vehicle fleet (the midpoint of the 9-year exposure period) or using emissions for a 2041 vehicle fleet (the midpoint of the 30-year exposure period) could be used; however, either of these would be less conservative.

American Meteorological Society/Environmental Protection Agency Regulatory Model Dispersion Modeling

To assess the dispersion of emissions associated with the project, air dispersion modeling was performed using AERMOD. The model is approved by the EPA when estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to calculate the annual average pollutant concentrations associated with each emitting source. Inputs for each emitting source were based on the characterizations described above. Details of these inputs are included in Appendix A and B.

For the volume sources used to represent on-road mobile source activity, vertical (sigma z) dispersion parameters were developed as described in the SCAQMD's modeling guidance for trucks. For the truck unloading locations, individual point sources represent the trucks idling at each loading dock. For all the idling sources, the release parameters were set to the SCAQMD default parameters. Receptors were placed at the nearest sensitive receptor locations.

The model requires additional input parameters, including local meteorology. Due to the model's sensitivity to individual parameters (e.g., wind speed, temperature, and direction), the EPA recommends meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. As such, 5 years of meteorological data from SCAQMD's Chino Airport Station (the nearest available station) were used to represent local weather conditions and prevailing winds. Figure 3, above, shows the graphical representation of the wind patterns. Receptors were placed at the nearest sensitive receptor locations, as shown in Figure 4, Sensitive Receptor Grid.

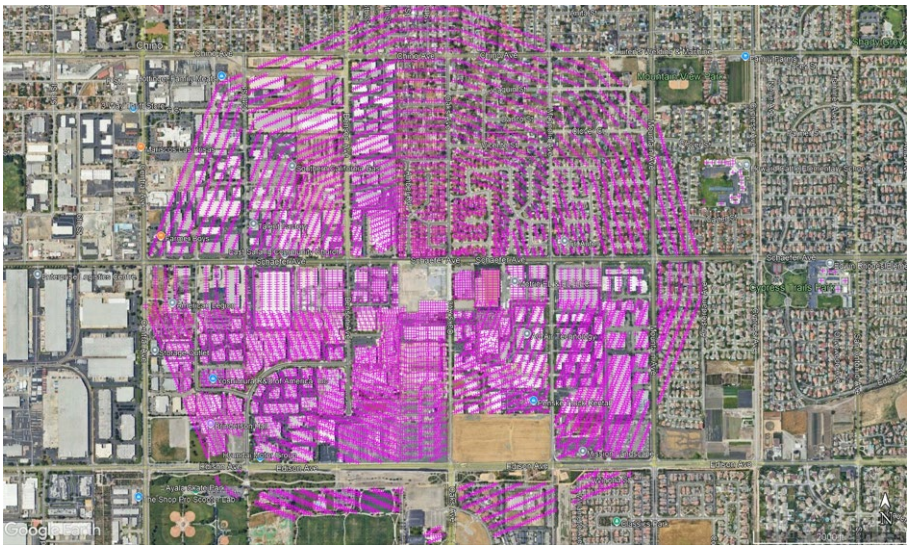

Figure 4: Sensitive Receptor Grid

Hot spots Analysis and Reporting Program Modeling

CARB's HARP2 model is a tool that assists with the programmatic requirements of the Air Toxics "Hot Spots" Program (AB 2588). HARP2 was used to translate the TAC concentrations from AERMOD into long-term carcinogenic and chronic, and short-term acute health risk levels following the guidance in the SCAQMD and OEHHA risk assessment guidelines. These guidelines specify a minimum set of TAC pathways and HARP2 modeling options for the carcinogenic assessment. To estimate chronic noncancer risks at residential receptors, the "RMP-Derived Method" risk-calculation option was used. Following the OEHHA guidance, an 8-hour chronic noncancer risk was calculated for residential receptors because the project would operate more than 8 hours per day and 5 days per week.

The dose-response relationship for a specific pollutant describes the association between exposure and the observed response (health effect). In other words, the relationship estimates how different levels of exposure to a pollutant change the likelihood and severity of health effects. The dose-response relationship (the response occurring with increasing doses) varies with each pollutant, individual sensitivity, and type of health effect. Combining the results of the emission characterization and dispersion modeling described above with the dose-response assessment gives an estimate of the increased health risk for an individual exposed to the maximum predicted long-term concentrations of TACs.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were default rates as presented in the OEHHA guidance document entitled *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[16] and guidance from SCAQMD.

[16] OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual*. March. Website: oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0 (accessed April 2025).

HEALTH RISK IMPACTS

The following section describes the potential impacts on sensitive and worker receptors from construction and operation of the proposed project. As identified above, the nearest sensitive receptors in the project vicinity are the single-family residences across Schaefer Avenue approximately 90 feet north of the northern edge of the project site. The nearest worker receptors to the project site are immediately east and south of the project site at approximately 90 feet and 70 feet, respectively. The nearest school is approximately 3,682 feet northeast of the project site. The HRA analysis and results are presented below; data outputs are included in Appendix A and B.

CONSTRUCTION HEALTH RISK ASSESSMENT

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. Table A, below, identifies the results of the analysis at the MEI locations. Model snap shots of the sources are included in Appendix A.

Table A: Health Risks from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential Receptor Risk	2.12	0.002	0
Worker Receptor Risk	0.09	0.005	0
School Receptor	0.01	<0.001	0
SCAQMD Significance Threshold	**10 in 1 million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (April 2025).
SCAQMD = South Coast Air Quality Management District

As shown in Table A, the maximum cancer risk for the residential MEI would be 2.12 in 1 million, which would not exceed the SCAQMD cancer risk of 10 in one million. The worker MEI would be 0.05 in 1 million and the school MEI would be 0.01 in 1 million, which would not exceed the threshold. The total chronic hazard index would be 0.002 for the residential MEI, 0.004 for the work receptor MEI, and less than 0.001 for the school receptor MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0), which would also not exceed the threshold of 1.0. Therefore, construction of the proposed project would not exceed SCAQMD thresholds and would not expose nearby sensitive receptors to substantial pollutant concentrations. No significant health risk would occur from project construction emissions.

OPERATIONAL HEALTH RISK ASSESSMENT

To determine the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed project. Table B shows the carcinogenic and chronic health risks from the proposed project. Model details are included in Appendix B.

Table B: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential Receptor Risk	1.96	<0.001	<0.001
Worker Receptor Risk	0.21	<0.001	<0.001
School Receptor	0.02	<0.001	<0.001
SCAQMD Significance Threshold	**10.0 in 1 million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (April 2025).
SCAQMD = South Coast Air Quality Management District

The residential risk conservatively incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence). An exposure period of 25 years was assumed for worker receptors, and a 9-year exposure duration was conservatively assumed for the school receptors.

As shown in Table C, the maximum cancer risk for the residential MEI would be 1.96 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be 0.21 in 1 million, and the school receptor risk would be 0.02 in 1 million, which would also not exceed the threshold. The total chronic hazard index would be less than 0.001 for the residential MEI, the school MEI, and the Worker MEI, which is below the threshold of 1.0.. In addition, the total acute hazard index would be less than 0.001, which would also not exceed the threshold of 1.0. As these results show, all health risk levels to nearby receptors from operation-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from project operation emissions.

CONCLUSION

Based on the results of the analysis, construction of the proposed project would not exceed SCAQMD thresholds and would not expose nearby sensitive receptors to substantial pollutant concentrations. All health risk levels to nearby sensitive receptors from operation -related emissions of TACs would also be well below the SCAQMD's HRA thresholds. As such, no significant health risk would occur from project-related emissions. The HARP modeling reports and AERMOD information are included in Appendix A and B.
