SUBJECT: MAJESTIC CHINO HERITAGE SUPPLEMENTAL AQ, GHG, HRA, & EA BASED ON EMFAC2017 EMISSION RATES

The following memorandum was prepared for the proposed Majestic Chino Heritage development (Project) which is located on the southeast corner of Mountain Avenue and Bickmore Avenue in the City of Chino. This memorandum has been prepared to supplement information in the *Majestic Chino Heritage Air Quality Impact Analysis (AQIA), Majestic Chino Heritage Greenhouse Gas Analysis (GHGA), and Majestic Chino Heritage Energy Analysis (EA)* reports prepared in August 2019 by Urban Crossroads, Inc.

PROJECT AIR QUALITY EMISSIONS

MODEL EMPLOYED TO ANALYZE AIR QUALITY & GREENHOUSE GAS EMISSIONS

EMFAC2017 Emission Rates

On August 19, 2019, the EPA approved the 2017 version of the Emission Factor model (EMFAC) web database for use in State Implementation Plan and transportation conformity analyses. EMFAC2017 is a mathematical model that was developed to calculate emission rates, fuel consumption, VMT from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by the CARB to project changes in future emissions from on-road mobile sources (3). This supplemental assessment utilizes summer, winter, and annual EMFAC2017 emission factors in order to derive vehicle emissions associated with Project construction and operational activities, which vary by season. Output from the model runs for are provided in Attachments A and B.

REGIONAL CONSTRUCTION EMISSIONS SUMMARY

PROJECT GREENHOUSE GAS EMISSIONS

GHG emissions impacts were modeled employing the CalEEMod 2016.3.2. Outputs from the model runs are provided in Attachments A and B. As shown on Table 7, the Project would generate a total of approximately 21,289.67 $MTCO_2e$ per year.

PROJECT HEALTH RISK ASSESSMENT

Construction Impacts

The land use with the greatest potential exposure to Project construction DPM source emissions is located approximately 135 feet east of Excess Fill Dirt Site #1 and 135 feet south of Excess Fill Dirt Site #2 which represents an existing equestrian center (where an individual caretaker could remain for 24 hours per day). At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project construction DPM source emissions is estimated at 2.03 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.05, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction activity. All other receptors during construction activity would experience less risk than what is identified for this location.

Operational Impacts

Residential Exposure Scenario:

The residential land use with the greatest potential exposure to Project DPM source emissions is located at the southeast of corner of Central Avenue and Fairfield Ranch Road (more than 7,000 feet from the Project site). This location experiences the greatest potential exposure to Project DPM source emissions due to meteorological conditions and the anticipated truck travel patterns anticipated for the Project, even though the nearest residential receptor location relative to the Project site itself is located approximately 3,594 feet to the west of the Project site in the City of Chino Hills. At the MEIR, the maximum incremental cancer risk attributable to Project DPM source emissions is estimated at 1.09 in one million, which is less than the threshold of 10 in one million. At this same location, non-cancer risks were estimated to be 0.0004, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to residences in the Project vicinity. All other modeled residential locations in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIR identified herein.

Worker Exposure Scenario:

The worker receptor land use with the greatest potential exposure to Project DPM source emissions is located immediately adjacent to the north of the Project site at an existing warehouse use. At the maximally exposed individual worker (MEIW), the maximum incremental cancer risk impact at this location is 0.36 in one million which is less than the threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be 0.001, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to adjacent workers. All other modeled worker locations in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIW identified herein.

School Child Exposure Scenario:

The school site land use with the greatest potential exposure to Project DPM source emissions is at the Cal Aero Preserve Academy located approximately 2 miles northeast of the Project site. At the maximally exposed individual school child (MEISC), the maximum incremental cancer risk impact attributable to the Project at this location is calculated to be an estimated 0.04 in one million which is less than the significance threshold of 10 in one million. At this same location, non-cancer risks attributable to the Project were calculated to be 0.00007, which would not exceed the applicable significance threshold of 1.0. Any other schools near the Project site would be exposed to less emissions and consequently less impacts than what is disclosed for the MEISC. As such, the Project will not cause a significant human health or cancer risk to nearby school children.

There are no schools located within a ¼ mile of the Project site or primary truck route. As such, there would be no significant impacts that would occur to any schools in the vicinity of the Project.
